Definitions

Re-introduction: an attempt to establish a species in an area which was once part of its historical range, but from which it has been extirpated or become extinct.

Re-establishment: a successful re-introduction.

Re-establishment project: a synonym for re-introduction; a project that attempts to successfully establish a species in an area which was once part of its historical range, but from which it has been extirpated or become extinct.

EXECUTIVE SUMMARY

Re-establishment has received increased attention as a conservation tool over the last two decades resulting in an increase in re-establishment projects worldwide (World Conservation Union and Species Survival Commission Re-introduction Specialist Group (IUCN/SSC RSG) 1995). As re-establishments are sometimes recommendations of action plans and other conservation initiatives it is vital that their occurrence, progress and outcomes are recorded (1) to inform future re-establishment projects for related species, and (2) to allow the implementation of action plans and other conservation initiatives to be monitored.

This report reviews waterbird species re-establishment projects, as per item 7.4 (f) of the African-Eurasian Waterbird Agreement (AEWA) Action Plan.

Seven major objectives were addressed: identifying the species for which reestablishment has been recommended as a conservation measure; identifying the waterbird conservation initiatives with provisions on re-establishment; creating a metadatabase containing all relevant data on re-establishments of waterbirds in the AEWA region; assessing existing re-establishment projects against IUCN guidelines; assessing the status of and progress in the implementation of re-establishments by Range States and other stakeholders; and producing recommendations for the future use of re-establishment as a conservation tool.

The review found that re-establishment has been recommended as a conservation measure for six waterbird species in international and national actions plans published since 1995: Lesser White-fronted Goose *Anser erythropus*, Ferruginous Duck *Aythya nyroca*, Crested Coot *Fulica cristata*, White-headed Duck *Oxyura leucocephala*, Maccoa Duck *Oxyura maccoa*, and Corn Crake *Crex crex*. Each of these species except for the Maccoa Duck has been the subject of one or more re-establishment projects within the AEWA region. Most projects have failed to result in self-sustaining populations, though varying levels of success have been reported for projects to re-introduce White-headed Duck in Spain, Ferruginous Duck in Italy, Lesser White-fronted Geese in Sweden, and Corn Crake in the United Kingdom.

Of 59 conservation initiatives reviewed, 15 had provisions on re-establishment. These initiatives included national and international action plans, international conventions and agreements, and conservation assessment and management plans. The re-establishment recommendations ranged from calling for re-introductions in previously occupied areas according to IUCN guidelines, to calling for a particular numbers of birds to be released in particular areas.

A potentially web-accessible meta-database was constructed and populated with data relevant to re-establishments of waterbirds in the AEWA region, incorporating information on species, Range States, conservation initiatives, re-establishment projects, references, re-establishment contacts, and data collected as part of a questionnaire survey.

The assessment of existing re-establishment projects found that compliance to IUCN re-introduction guidelines varied from 23% for a White-headed Duck re-introduction in Hungary to 88% for a Corn Crake re-introduction in the United Kingdom. Evaluating success and comparing this with level of compliance indicated that projects showing greater compliance to IUCN guidelines are more likely to be successful.

Re-establishment projects have been implemented for four of the five species for which re-establishment has been recommended in an international single species action plan (ISSAP). The only species where re-establishment has not been implemented despite a recommendation is the Maccoa Duck. Re-establishment projects have been conducted for 33% of the threatened species and 3% of the non-threatened species covered by AEWA.

A number of factors were identified as particularly important to success. These were the completion of a comprehensive feasibility study; pre-release acclimatization of birds to their release area; good quality habitat with the original causes of decline eliminated or reduced; long-term financial and political support; and identification of short and long-term indicators of success.

In order to improve the success of re-establishment as a conservation tool for waterbird species this report recommends that:

- 1. Re-establishment projects are conducted in strict accordance with the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995).
- 2. The *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) are adapted for waterbird species and supplemented with checklists of activities for practitioners to complete.
- 3. The IUCN/SSC Re-introduction Specialist Group (IUCN/SSC RSG) is consulted prior to any re-establishment project.
- 4. Re-establishment projects are conducted by groups of organisations and experts with diverse skills bases.
- 5. Networks or groups of experts with knowledge relevant to re-establishments of a specific species are assembled to act as advisory groups for re-establishment projects of the relevant species.
- 6. During pre-project activities, particular attention is paid to completing a comprehensive feasibility study and securing long-term financial and political support.
- 7. During re-introduction activities, particular attention is paid to ensuring birds are acclimatized to their release area, a sufficient amount of good quality habitat is available where the original causes of decline have been eliminated or sufficiently reduced, and short and long-term indicators of success are identified.
- 8. AEWA National Focus Points maintain a national register of re-establishment projects occurring or planned to occur wholly or in part within their Ranges States.
- 9. All re-establishment projects are described to the IUCN/SSC RSG.
- 10. The AEWA re-establishment database is maintained.
- 11. A standard set of evaluation criteria for waterbird re-establishment projects is developed.

1 INTRODUCTION

The variety and numbers of waterbirds on their breeding grounds, migration stop-over sites, and wintering grounds has been reduced due to several factors, among others partial or full destruction or alteration of habitats, unsustainable harvesting, pollution, and invasive alien species.

The African-Eurasian Waterbird Agreement (AEWA) entered into force in 1999 and focuses on the conservation of 235 waterbird species in 117 Range States in Africa, Europe, and parts of Canada, Central Asia and the Middle East. AEWA calls on its Parties to engage in a wide range of conservation actions including the use of re-establishment.

Re-establishment has received increased attention as a conservation tool over the last two decades resulting in an increase in re-establishment projects worldwide (World Conservation Union and Species Survival Commission Re-introduction Specialist Group (IUCN/SSC RSG) 1995). As re-establishments are sometimes recommendations of action plans and other conservation initiatives it is vital that their occurrence, progress and outcomes are recorded (1) to inform future re-establishment projects for related species, and (2) to allow the implementation of action plans and other conservation initiatives to be monitored.

IUCN defines 're-establishment' as a successful 're-introduction', a successful 'attempt to establish a species in an area which was once part of its historical range, but from which it has been extirpated or become extinct'. A re-introduction contrasts with a 'translocation', which is the 'deliberate and mediated movement of wild individuals or populations from one part of their range to another'; a 'reinforcement/supplementation', which is the 'addition of individuals to an existing population of conspecifics'; and a 'conservation/benign introduction', which is 'an attempt to establish a species, for the purpose of conservation, outside its recorded distribution but within an appropriate habitat and ecogeographical area' (IUCN/SSC RSG 1995).

The *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) provide specific policy guidelines for each stage of a re-introduction (i.e. a re-establishment project) and state that the objectives of a re-introduction may be to enhance the long-term survival of a species; to re-establish a keystone species (in the ecological or cultural sense) in an ecosystem; to maintain and/or restore natural biodiversity; to provide long-term economic benefits to the local and/or national economy; to promote conservation awareness; or a combination of these (IUCN/SSC RSG 1995).

Paragraph 2.4 of AEWA's Annex 3 (Action Plan) reads: "Parties shall exercise the greatest care when re-establishing populations listed in Table 1 into parts of their traditional range where they no longer exist. They shall endeavour to develop and follow a detailed reestablishment plan based on appropriate scientific studies. Re-establishment plans should constitute an integral part of national and, where appropriate, international single species action plans. A re-establishment plan should include assessment of the impact on the environment and shall be made widely available. Parties shall inform the Agreement secretariat, in advance, of all re-establishment programmes for populations listed in Table 1."

The third Meeting of Parties (MOP3) in paragraph 6 of Resolution 3.11, requested the Technical Committee urgently to implement the international context reviews specified in paragraph 7.4 of the Action Plan - including a review of re-establishment projects - to provide future Meetings of Parties with context on these issues.

This report reviews waterbird species re-establishment projects, as per item 7.4 (f) of the AEWA Agreement's Action Plan, with the following objectives:

- 1. Produce a list of those species for which re-establishments have been identified to be needed, as a priority for the populations listed in Category 1, Column A, Table 1 of the AEWA Action Plan and provide the context against which this has happened.
- 2. Produce a list of waterbird conservation initiatives requesting or promoting the implementation of re-establishments, record the relevant text and assess the content of these recommendations.
- 3. Set up a meta-database that contains relevant information on:
 - those species for which re-establishment plans have been prepared (and implemented);
 - those species for which re-establishment plans are under development; and
 - those species for which re-establishment plans remain to be developed.
- 4. Assess re-establishment projects that have occurred for AEWA species in the AEWA region in terms of their compliance to IUCN re-introduction guidelines.
- 5. Assess the status of and progress in the implementation of re-establishment projects by Range States and other stakeholders.
- 6. Assess the effectiveness of waterbird re-establishment projects in the AEWA region and determine the factors most linked to success in these projects.
- 7. Provide recommendations for the future use of re-establishment as a conservation tool and outline the improvements needed.

2 SPECIES FOR WHICH RE-ESTABLISHMENTS ARE NEEDED

2.1 Objective

Produce a list of those species for which re-establishments have been identified to be needed, as a priority for the populations listed in Category 1, Column A, Table 1 of the AEWA Action Plan and provide the context against which this has happened.

2.2 Method

A total of 38 action plans for waterbird species were reviewed (Table 2-1) to determine for which species re-establishment had been recommended as a conservation measure. The action plans included Council of Europe and European Union action plans; AEWA/CMS action plans; African action plans for globally threatened species; and other national and international action plans. The action plans reviewed represent a sample of the total number available. In particular, it should be noted that only English language action plans were included and of the seven national action plans reviewed, five (71%) were for the United Kingdom. Updates of this review should aim to include non-English action plans and national action plans from a wider range of countries.

Table 2-1. Waterbird action plans reviewed for re-establishment recommendations.

UK Biodiversity Action Plan - Corn Crake (Crex crex)	(UKBAP 1995b)
UK Biodiversity Action Plan - Red-necked Phalarope (Phalaropus lobatus)	(UKBAP 1998b)
UK Biodiversity Action Plan - Roseate Tern (Sterna dougallii)	(UKBAP 1998c)

After an initial list of species was drawn up, consultations were conducted with AEWA National Focal Points to finalise the list – all National Focal Points were asked if reestablishment had been recommended as a conservation measure for any AEWA species in their Range State. Gaps were filled by consulting relevant ornithological experts, including Wetlands International Specialist Group chairs, BirdLife International contacts and International Waterbird Census coordinators.

The action plans recommending re-establishment were identified and the details noted. For each species with a recommendation, background species information (distribution, IUCN Red List status and factors causing loss or decline/major threats) was gathered to provide context for the recommendations.

Finally, for each species with a recommendation, as much information as possible was gathered on re-establishment projects that have been completed, are being conducted, or are being planned to occur in AEWA Range States. Information was gathered by searching scientific literature, popular literature and websites, and by consulting National Focal Points - all National Focal Points were asked if any re-establishments had been conducted or were planned for any AEWA species in their Range State. Again, gaps were filled by consulting relevant ornithological experts, including Wetlands International Specialist Group chairs, BirdLife International contacts and International Waterbird Census coordinators.

2.3 Results

The 38 action plans reviewed covered 43 waterbird species to which AEWA applies; 21 of these species have international single species action plans (ISSAPs); and an additional 2 have national single species action plans. The species for which action plans recommend re-establishment activities are listed in Table 2-2 with the number of action plans reviewed, the number recommending re-establishment and the IUCN Red List Status (2007) of each species.

Table 2-2. Species with action plans recommending re-establishment activities.

Species	IUCN Red List Status (2007) ¹ *	No. of action plans reviewed	No. of action plans recommending re-establishment
Corn Crake Crex crex	NT	3	1
Crested Coot Fulica cristata	LC	1	1
Ferruginous Duck Aythya nyroca	NT	2	1
Lesser White-fronted Goose Anser erythropus	VU	3	1
Maccoa Duck Oxyura maccoa	NT	2	1
White-headed Duck Oxyura leucocephala	EN	2	1

^{*} EN = endangered, VU = vulnerable, NT = near threatened, LC = least concern.

Re-establishment was recommended for only 6 species (Table 2-2): Corn Crake (UKBAP 1995b), Crested Coot (Gomez 1999), Ferruginous Duck (Callaghan 1997), Lesser White-fronted Goose (Madsen 1996), Maccoa Duck (Abebe *et al.* 2007) and White-headed Duck (Hughes *et al.* 2006). However, as indicated in Table 2-2, re-establishment was not recommended for five of these six species in at least one other action plan. Of the 10 threatened species covered by the ISSAPs, just two (Lesser White-fronted Goose and White-headed Duck) were recommended for re-establishment, and the latest draft of the Lesser White-fronted Goose ISSAP does not recommend re-establishment (Jones 2006).

Re-establishment was discussed at some length in the 1996 *Action Plan for the Dalmatian Pelican Pelecanus crispus in Europe* (Crivelli 1996). However, the action plan did not recommend re-establishment, but did recommend that re-introduction techniques were investigated.

The six species for which re-establishment was recommended are discussed in detail in the following sections.

¹ Source: IUCN. 2007. 2007 IUCN Red List of Threatened Species. < www.iucnredlist.org >. Downloaded 28 September 2007.

(a) Corn Crake Crex crex

Re-establishment of this species was recommended in the 1995 *UK Biodiversity Action Plan Corn Crake Crex crex* (UKBAP 1995b) as a long-term conservation measure to reestablish the Corn Crake in parts of its former range in the United Kingdom. Reestablishment is not recommended in the 1996 *Action Plan for the Corn Crake (Crex crex) in Europe* (Crockford *et al.* 1996) or the 2006 *International Single Species Action Plan for the Conservation of the Corn Crake (Crex crex)* (Koffijberg & Schaffer 2006).

(br - breeding; ex - extinct; v - vagrant; ? - outstanding query over status)

Status³

IUCN Red List: NT (BirdLife International 2006) Trend: ▼

"Recent surveys in eastern Europe and new population estimates for Asiatic Russia and have shown this species to be considerably more numerous than was thought in the early 1990s. New information suggests that future declines in European Russia are in the region of 10% over the next 10 years because the introduction of intensive agricultural technologies in some areas will be compensated for by the reduction of agricultural production in other areas. In Asiatic Russia, where the bulk of the world population breeds, declines of c. 20% are predicted on the basis of land abandonment, with meadows becoming overgrown by bushy vegetation and trees. For this reason the species is listed as Near Threatened. Nearly qualifies as threatened under criteria A3c" (BirdLife International 2006)

Factors causing loss or decline (United Kingdom)⁴

- Loss of traditional grassland habitat mosaics, especially tall vegetation throughout the breeding season.
- Changes in grass management and cutting techniques (e.g. earlier cutting).
- Predation and disturbance may be contributing to the decline in some localities.

UK Biodiversity Action Plan - Corn Crake *Crex* crex. Originally published in: Biodiversity: The UK Steering Group Report - Volume II: Action Plans (December 1995, Tranche 1, Vol. 2, p102).

Completed and ongoing re-establishment projects

i. AEWA Range State: UNITED KINGDOM

Region: Cambridge, England

Organisations involved: RSPB, Whipsnade Wild Animal Park (Zoological Society of

London), Natural England, and Pensthorpe Conservation Trust

Start year: 2000 End year: Ongoing

Comments: Some 291 birds were released between 2002 and 2006. Released birds

have successfully returned from overwinter migration to Africa and have

successfully bred in the wild. The long-term goal of the project is the establishment

of a stable population of over 30 pairs.⁵

Planned re-establishment projects

None known.

⁵ From a questionnaire completed and returned by Andy Evans (RSPB) (see Appendix 2)

(b) Crested Coot Fulica cristata

Maintaining a captive breeding population of this species for future re-introductions was considered of medium priority in the 1999 *International Species Action Plan Crested Coot Fulica cristata* (Gomez 1999). The action plan recommended that a re-introduction programme following IUCN guidelines should be implemented in Spain between the Andalucía and Valencia Regions with a total of 50 pairs re-introduced.

Status⁷

IUCN Red List: LC (BirdLife International 2004)

Trend: N/A

"This species has a large range, with an estimated global extent of occurrence of 5,400,000 km². It has a large global population estimated to be 110,000–1,000,000 individuals (Wetlands International 2002). Global population trends have not been quantified, but the species is not believed to approach the thresholds for the population decline criterion of the IUCN Red List (i.e., declining more than 30% in 10 years or 3 generations). For these reasons, the species is evaluated as Least Concern" (BirdLife International 2004)

Major threats⁸

- Habitat Loss (importance: critical)
- Habitat Degradation (importance: critical)
- Livestock (importance: high)
- Hunting (importance: medium)
- Fishing (importance: medium)
- Disturbance (importance: low)
- Interaction with Greater Flamingos Phoenicopterus ruber roseus (importance: unknown)
- Introduction of other species (importance: unknown)
- Lead poisoning (importance: unknown)

(br - breeding; v - vagrant; ? - outstanding query over status)

Status¹¹

IUCN Red List: NT (BirdLife International 2006) Trend: ▼

"Given that this species' range may fluctuate considerably from year to year - particularly in Asia - owing to changing water levels, it is very hard to estimate the global population or trends. Owing to significant local declines it is classified as Vulnerable in Europe. However, evidence of declines in the larger Asian populations is sparse, and sometimes contradictory, so it is currently listed as Near Threatened. Evidence of rapid declines in Asia may warrant uplisting to Vulnerable. Nearly qualifies as threatened under criteria A2cd+3cd" (BirdLife International 2006)

Major threats¹²

- Habitat Loss/Degradation (importance: critical)
- Climate change/drought (importance: critical)
- Over-hunting (importance: high)
- Lead poisoning (importance: medium)
- Drowning in fishing nets (importance: medium)
- Pollution (importance: medium)
- Competition with invasive alien species (importance: medium)
- Human disturbance (importance: medium)

Competition with native species (importance: unknown)

Source of re-establishment recommendation

Callaghan D (compiler). 1997. European Species Action Plan Ferruginous Duck (*Aythya nyroca*). The European Commission and BirdLife International.

Completed and ongoing re-establishment projects

i. AEWA Range State: FRANCE Region: Villars des Dombes

Start year: 1970s

Comments: An unsuccessful re-introduction was carried out in the 1970s in Villars

des Dombes. 13

ii. AEWA Range State: SPAIN

Region: Acebuche-Huerto-Pajasarea of the Guadalquivir Marshes

Organisations involved: Instituto para la Conservación de la Naturaleza (ICONA)

Start year: 1992

Comments: A re-introduction programme was launched by the Instituto para la Conservación de la Naturaleza (ICONA) in southwest Spain in 1992. In the Acebuche-Huerto-Pajasarea of the Guadalquivir Marshes, 49 individuals were released in 1992 and 1993, from which 3 pairs bred in 1993. A further 45 were released in southwest Spain during 1994 and 1995, and over 30 in 1996. ¹³

iii. AEWA Range State: ITALY

Comments: There have been around 20 re-introduction programmes in Italy over the past decade. Although most have been unsuccessful, apparently self-sustaining breeding populations were established at the Eastern Bologna Plain and Alviano Lake. ¹³

iv. AEWA Range State: FRANCE

Region: Le Marais de Ganne

Comments: A re-introduction is being attempted at Le Marais de Ganne (Saint Andre des Eaux), where an open enclosure of pinioned birds is used to breed fullywinged juveniles. In 1996, 10 pinioned birds raised 10 fully-winged individuals.¹³

Planned re-establishment projects

None known.

(d) Lesser White-fronted Goose Anser erythropus

Re-establishment of the Lesser White-fronted Goose was recommended in the 1996 International Action Plan for the Lesser White-fronted Goose Anser erythropus (Madsen 1996) for areas where the species has disappeared and other conservation measures have failed. However the updated second draft of the 2006 International Action Plan for the Lesser White-fronted Goose Anser erythropus (Jones 2006) did not make such a recommendation and concludes that there is no consensus among Lesser White-fronted Goose stakeholders on the use of captive breeding and re-introduction/restocking as valid conservation tools to be integrated with measures directed at conservation of the surviving wild population.

In November 2005, the Scientific Council of the Convention on Migratory Species (CMS) concluded, as part of its wider recommendation on Lesser White-fronted Geese that:

"For the present, we do not support the introduction of Lesser White-fronts into flyways where they do not occur naturally. We have borne in mind the powerful argument concerning the improved safety of birds in these flyways, as well as practical considerations, such as current proposals that could quickly be put into effect. However, we consider that modifying the natural behaviour of Lesser White-fronts in this respect, as well as unknown ecological effects in the chosen new flyways, and other such considerations, make this technique inappropriate until such time as it may become essential, particularly when major disruption or destruction occurs of key components of the natural flyways. We do not believe that to be the case at present." ¹³

Distribution¹⁴

Albania, Armenia, Austria (v), Azerbaijan, Belarus, Belgium (v), Bosnia and Herzegovina, Bulgaria, China, Croatia, Cyprus (v), Czech Republic, Denmark (v), Egypt (v), Estonia, Finland (br), France (v), Georgia, Germany, Greece, Hungary, India, Iran (Islamic Republic of), Iraq, Ireland (v), Israel, Italy, Japan, Jordan (v), Kazakhstan, Korea (Republic of) (v), Kuwait (v), Latvia, Lithuania, Moldova (Republic of), Mongolia, Myanmar (v), Netherlands (v), Norway (br), Oman (v), Pakistan, Poland, Romania, Russian Federation (br), Serbia and Montenegro, Slovakia, Spain, Sweden (br), Switzerland (v), Syrian Arab Republic, Taiwan, Province of China (v), The former Yugoslav Republic of Macedonia, Turkey, Turkmenistan, Ukraine, United Arab Emirates (v), United Kingdom (v), United States (v), and Uzbekistan.

(br - breeding; v - vagrant)

Status¹⁵

IUCN Red List: VU A2bcd+3bcd (BirdLife International 2006) Trend: **★**

"This species is listed as Vulnerable because it has suffered a rapid population reduction in its key breeding population in Russia, and equivalent declines are predicted to continue over the next 10 years. The small Fennoscandian population has undergone a severe historical decline." (BirdLife International 2006)

Major threats¹⁶

- Hunting breeding grounds (importance: medium)
- Hunting staging/wintering grounds (importance: critical)
- Poisoning staging/wintering grounds (importance: local)
- Human disturbance staging/wintering grounds (importance: medium)
- Human disturbance breeding grounds (importance: local)

Madsen J (compiler). 1996. International Action Plan for the Lesser White-fronted Goose (*Anser erythropus*). Pp. 67-78 in Heredia, B, Rose, L & Painter, M (eds). *Globally threatened birds in Europe: action plans*. The European Commission and BirdLife International, Strasbourg.

Completed and ongoing re-establishment projects

i. AEWA Range State: **SWEDEN** Region: Swedish Lapland

Start year: 1981 End year: 1999

Comments: 348 captive-bred Lesser White-fronted Geese were released in Swedish Lapland. Barnacle Geese *Branta leucopsis* were used as foster-parents and the reintroduced Lesser White-fronted Geese followed their foster parents to wintering grounds in the Netherlands. A total of 66 young fledged from breeding attempts in the release area up to 1999. The number of fledglings reared between 1999 and 2003 ranged from 13 to 20 annually, with a total for the 5-year period of 83 fledglings from 29 broods.¹⁷

ii. AEWA Range State: FINLAND

Region: Finnish Lapland

Start year: 1987 End year: 1997

Comments: Between 1987 and 1997 about 150 captive-bred Lesser White-fronts were released in Finnish Lapland, but high mortality occurred and no breeding attempts were made by the re-introduced birds. This re-introduction programme did not aim to modify goose migration routes (Markkola *et al.* 1999). Releases were stopped from 1998 (Markkola *et al.* 1999), though Lesser White-fronted Geese continued to be bred in captivity.¹⁷

¹⁷ Jones T (compiler). 2006. International Action Plan for the Lesser White-fronted Goose (*Anser erythropus*) – Updated second draft. The European Commission and AEWA.

Planned re-establishment projects

i. AEWA Range States: GERMANY & SWEDEN Region: Swedish Lapland and the Lower Rhine area of Germany Organisations involved: Operation Lesser White-fronted Goose/Aktion Zwerggans Comments: This new international, German-based project aims to breed up to 400 Lesser White-fronted Geese in four years and release them in Lapland. The practitioners intend to use ultra-light aircraft as 'foster parents' to guide the birds to wintering grounds in the Lower Rhine area of Germany. Experimental work has been conducted over a six year period.¹⁸

(f) White-headed Duck Oxyura leucocephala

Re-establishment of the White-headed Duck was recommended in the 2006 International Single Species Action Plan for the Conservation of the White-headed Duck Oxyura leucocephala (Hughes et al. 2006). The action plan recommends that the species is reintroduced to formerly occupied sites, if IUCN criteria can be met. The 1996 Action Plan for the White-headed Duck Oxyura leucocephala in Europe (Green & Hughes 1996) recommended that re-introductions should be postponed until the problem of the introduced Ruddy Duck Oxyura jamaicensis was resolved.

Distribution²²

Afghanistan (br), Albania, Algeria (br), Armenia (br), Austria (v), Azerbaijan, Belgium (v), Bosnia and Herzegovina (v), Bulgaria, China, Croatia (v), Cyprus, Czech Republic (v), ? Source of re-establishment recommendation

Hughes B, Robinson J, Green A, Li D & Mundkur T (compilers). 2006. International Single Species Action Plan for the Conservation of the White-headed Duck *Oxyura leucocephala*. AEWA Technical Series No. 8. Bonn, Germany.

Completed and ongoing re-establishment projects

i. AEWA Range State: FRANCE Region: Lake Biguglia, Corsica

Start year: 2001

Comments: An EU LIFE project, LIFE97 NAT/F/004226, to re-introduce White-headed Ducks was conducted at Lake Biguglia, Corsica. Five birds were released in 2001 but a self-sustaining population was not established. Three of the released birds disappeared rapidly, the fourth a little later and the fifth one year after release. The White-headed Duck was used as a flagship species for the Biguglia nature reserve and an education programme was conducted.²⁵

ii. AEWA Range State: HUNGARY

Start year: 1982 End year: 1992

Comments: Four releases of more than 52 birds occurred between 1982 and 1992 but a self-sustaining population could not be attained - the project was terminated

in 1992.^{25, 26}

iii. AEWA Range State: ITALY

Region: Gargano National Park, SE Apulia

Start year: 1988

Comments: Ongoing re-establishment project at Gargano National Park, SE Apulia,

but self-sustaining population not yet established. ²⁵

iv. AEWA Range State: SPAIN

Region: Mainland

Comments: A wild population of >1,200 birds was established, but the exact contribution of the re-establishment project to this population is unknown. ²⁵

Region: Majorca Start year: 1995

Comments: Re-introduction programme conducted in Majorca, but no birds have been re-introduced since 1995 and a self-sustaining population has not been

established. 25

Planned re-establishment projects

None known.

²⁶ From a questionnaire completed and returned by Bálint Bajomi (see Appendix 2)

3 WATERBIRD CONSERVATION INITIATIVES REQUIRING RE-ESTABLISHMENT

3.1 Objective

Produce a list of waterbird conservation initiatives requesting or promoting the implementation of re-establishments, record the relevant text and assess the content of the recommendations.

3.2 Method

A total of 59 waterbird conservation initiatives were reviewed to determine which had provisions on re-establishment and to record the relevant text relating to re-establishment. The initiatives included international conventions and agreements, the Anseriformes action plan and other legally non-binding conservation initiatives, both national and international. To finalise the list, consultations were conducted with AEWA National Focal Points, and gaps were filled by consulting relevant ornithological experts, including Wetlands International Specialist Group chairs, BirdLife International contacts and International Waterbird Census coordinators.

For a complete list of the initiatives reviewed, see Appendix 1.

To assess the content and specificity of the recommendations in international single species action plans (ISSAPs), the text of each ISSAP was broken-down into components (for example, "re-establishments should be conducted according to IUCN re-introduction guidelines and only in areas where the species previously occurred" would have been broken-down into two components concerning IUCN guidelines and release site) and a master list of components was compiled. The text of each ISSAP was then compared against the master list.

3.3 Results

Of the 59 conservation initiatives reviewed, 15 (25%) had provisions on re-establishment (Table 3-1). Some six of these were ISSAPs, two were international action plans for more than one species, one was a national single species action plan, five were international conventions and agreements, and one was a conservation management plan (Table 3-1).

Table 3-1. Numbers of conservation initiatives with provisions on reestablishment.

Type of initiative	Number reviewed	Number with provisions on re-establishment (%)
International single species action plans	27	6 (22%)
Other international action plans	7	2 (29%)
National single species action plans	7	1 (14%)
International conventions and agreements	7	5 (71%)
Other (e.g. conservation management plans, directives and protocols)	11	1 (9%)
All	59	15 (25%)

Details of the provisions relevant to re-establishment as a conservation measure are presented in the following sections.

(a) International Action Plan for the Lesser White-fronted Goose Anser erythropus (Madsen 1996)

Re-introduction and re-stocking was recommended for the Lesser White-fronted Goose when other conservation measures had failed:

"Re-introduction and restocking may be accepted as an alternative way to minimise the risk of extinction of the species but should be applied only when other efforts to conserve the wild population appear to fail and the IUCN criteria for re-introductions are met (Kleiman *et al.* 1994). Re-introduction should only be carried out in areas where the species has disappeared, and measures should be taken to minimise risks to natural populations. As long as captive stocks of Lesser White-fronted Geese exist and can be maintained, there is no urgency for re-introduction and restocking. Therefore, these activities should have lower priority compared to measures focusing on the remaining wild populations. Re-introduction and restocking should be discontinued if a natural recovery of the wild population can be verified."

Geographical scope of the initiative: Azerbaijan, Bulgaria, Finland, Germany, Greece, Hungary, Kazakhstan, Lithuania, Norway, Romania, Russia, Sweden, Turkey and Ukraine.

Note: The 2006 International Action Plan for the Lesser White-fronted Goose Anser erythropus (Jones 2006) does not recommend re-introduction or re-stocking and concludes that there is no consensus among Lesser White-fronted Goose stakeholders on the use of captive breeding and re-introduction/restocking as valid conservation tools.

(b) International Species Action Plan Crested Coot Fulica cristata (Gomez 1999)

Maintaining a captive stock of Crested Coot was recommended as a conservation priority for the Crested Coot:

"Keeping a breeding population of Crested Coot in captivity to ensure a genetic stock of individuals, as well as increasing the productivity of the wild population by the systematic re-introduction of captive individuals into its natural habitats.

To keep a breeding population of Crested Coot in captivity... it is necessary to ensure a genetic stock of individuals, as well as to increase the productivity of the wild population by the regular re-introduction (following IUCN guidelines) of captive individuals into the wild."

Re-establishment was recommended as a conservation action specifically for Spain with the following instructions:

"Promote a joint captive breeding programme between Andalucía and Valencia Regions, with a total of 50 pairs. This programme should include:

- Control of genetic variability of individuals obtained in captivity
- Sanitary control of individuals in captivity
- Production of individuals for re-introduction"

"Promote a re-introduction programme following IUCN guidelines. A working group of scientists and technical staff interested in the species should be created to co-ordinate the re-introduction in both Andalucía and Valencia Regions, and should consider as a minimum:

- Number of individuals to release
- Choice of appropriate release sites
- Choice of appropriate release season
- Establishment of the release methodology

Promotion of a monitoring plan with marked individuals"

Geographical scope of the initiative: Spain, Morocco, Algeria and Portugal.

(c) International Single Species Action Plan for the Conservation of the White-headed Duck Oxyura leucocephala (Hughes et al. 2006)

Re-introduction was recommended to increase the breeding range of the White-headed Duck:

"Re-introduce White-headed Ducks to formerly occupied sites, if IUCN re-introduction criteria can be met."

Geographical scope of the initiative: Afghanistan, Algeria, Armenia, Azerbaijan, Bulgaria, China, France, Georgia, Greece, Iraq, Islamic Republic of Iran, Israel, Italy, Kazakhstan, Mongolia, Morocco, Pakistan, Romania, Russian Federation, Spain, Syrian Arab Republic, Tunisia, Turkey, Turkmenistan, Ukraine, Uzbekistan.

(d) International Single Species Action Plan for the Conservation of the Maccoa Duck Oxyura maccoa (Abebe et al. 2007)

Re-introduction was recommended for the Maccoa Duck into suitable sites in southern Tanzania:

"Re-introduction of birds in suitable sites in southern highlands of Tanzania

- 1. Identify suitable sites
- 2. Understand reasons for extirpation
- 3. Ensure previous threats no longer exist
- 4. Identify source of eggs/adults of same genetic stock
- 5. Desktop study of previous programmes/techniques
- 6. Collaboration with suitable partners
- 7. Re-introduction

Time-scale: Jan 06 - Jul 06"

Geographical scope of the initiative: Angola, Botswana, Burundi, Ethiopia, Kenya, Lesotho, Namibia, Rwanda, South Africa, Tanzania, Uganda, and Zimbabwe.

(e) Penguin conservation assessment and management plan (CAMP): report from the workshop held 8-9 September 1996, Cape Town, South Africa (Ellis *et al.* 1998)

The penguin CAMP proposed that re-introduction techniques should be investigated as a conservation measure:

"Means of establishing new colonies, or of manipulating colonies to expand in a certain direction (to minimize conflict with man), should be investigated. There is a likelihood that studies of behaviour of captive populations can help in this. The possibility of returning birds bred in captivity to the wild should be investigated. The purpose of this would be to augment populations at colonies that are presently depressed or decreasing, and to establish techniques for reintroductions before the overall population has decreased to a critical level. This is a complex procedure and will require the assistance of specialist groups outside southern Africa. The technique, if established, will have value for other *Spheniscus* penguins."

Geographical scope of the initiative: Namibia and South Africa.

(f) European Species Action Plan Ferruginous Duck *Aythya nyroca* (Callaghan 1997)

Re-introduction was recommended for the Ferruginous Duck to areas of its former range:

"Re-introduction ought to be considered a last measure in conservation strategies for this species, and any attempts ought to first fulfil the IUCN guidelines for re-introduction (Kleiman *et al.* 1994) and the guidelines developed by Black (1991) for bird re-introductions. Any current programmes that do not satisfy these criteria ought to be terminated, and resources spent more effectively."

Geographical scope of the initiative: Albania, Armenia, Austria, Azerbaijan, Belarus, Bosnia-Herzegovina, Bulgaria, Croatia, Czech Republic, France, Georgia, Germany, Greece, Hungary, Italy (including Sardinia), Lithuania, Moldova, Poland, Romania, Russia (European), Slovakia, Slovenia, Spain, Turkey, Ukraine, former Yugoslav Republic of Macedonia, and Yugoslavia (Serbia-Montenegro).

(g) Action Plan for the Dalmatian Pelican (*Pelecanus crispus*) in Europe (Crivelli 1996)

The Action Plan for the Dalmatian Pelican (Pelecanus crispus) in Europe (Crivelli 1996) recommended that:

"Techniques for the establishment of new colonies by re-introduction [are] investigated."

Geographical scope of the initiative: Morocco, Turkey and Syria.

(h) Cranes - Status survey and conservation action plan (*Meine & Archibald* 1996)

At the global level, it was recommended that scientists and conservationists share information about re-introduction techniques, and implement existing recommendations for the sound management and propagation of cranes in captivity and for the coordination of *in situ* and *ex situ* conservation strategies:

"To ensure that the populations of captive cranes are managed in a sound fashion, and that these efforts dovetail with re-introduction and habitat protection programmes, the IUCN/SSC Conservation Breeding Specialist Group has sponsored a series of intensive management workshops, the recommendations of which are recorded in the Crane Conservation Assessment and Management Plan (CAMP) and the Global Crane Action Recommendations (GCAR). Specific recommendations are presented on a species-by-species basis under Priority Conservation Measures in the species accounts in Section 2. Several recommendations are presented on a regional basis in the remainder of this section. These recommendations should be fully implemented as part of a comprehensive crane conservation effort, and should be reviewed and updated regularly."

Captive propagation and re-introduction is recommended for West Africa:

- "1. Assess the need for a release programme to re-establish the Black Crowned Crane in areas where it has been extirpated. This assessment should, however, stress the need to ensure protection and sound management of habitat before any releases are undertaken.
- 2. Expand training opportunities in crane husbandry, propagation, and reintroduction techniques."

Captive propagation and re-introduction is also recommended for East Africa:

- "1. Restrict, if necessary, the reproduction rate among captive Grey Crowned Cranes to allow more space for Black Crowned Cranes.
- 2. Develop a Global Animal Survival Plan and full PHVA for the Wattled Crane. *In situ* and *ex situ* conservation needs of the Ethiopian population should be determined as part of this process."

(i) Pan-European Biological and Landscape Diversity Strategy

The Pan-European Biological and Landscape Diversity Strategy is a European response to support implementation of the Convention on Biological Diversity. It was proposed in the Maastricht Declaration Conserving Europe's Natural Heritage (1993), and builds on the Bern Convention, the European Conservation Strategy (1990), the Dobrís and Lucerne Ministerial Conferences (1991, 1993), UNCED (1992), and other existing initiatives and programmes.

Article 9 states that as a measure of *ex situ* conservation each Contracting Party shall, as far as possible and as appropriate, and predominantly for the purpose of complementing *in situ* measures:

"Adopt measures for the recovery and rehabilitation of threatened species and for their re-introduction into their natural habitats under appropriate conditions."

(j) UK Biodiversity Action Plan - Corn Crake Crex crex (UKBAP 1995b)

Re-establishment is recommended as a long-term conservation objective for the Corn Crake in the United Kingdom:

"In the longer-term, re-establish Corn Crakes in parts of its former range in the UK."

(k) Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora

The aim of the European Union Habitats Directive is to protect biodiversity in Europe. Member States are required to report on the implementation of the Habitats Directive every 6 years.

Article 22 states that each Member State shall:

"Study the desirability of re-introducing species in Annex IV that are native to their territory where this might contribute to their conservation, provided that an investigation, also taking into account experience in other Member States or elsewhere, has established that such re-introduction contributes effectively to re-establishing these species at a favourable conservation status and that it takes place only after proper consultation of the public concerned."

(I) Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention)

The aims of the Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) are "to conserve wild flora and fauna and their natural habitats, especially those species and habitats whose conservation requires the cooperation of several States, and to promote such co-operation. Particular emphasis is

given to endangered and vulnerable species, including endangered and vulnerable migratory species."

Article 11 of Chapter V states that each contracting party shall:

"Encourage the re-introduction of native species of wild flora and fauna when this would contribute to the conservation of an endangered species, provided that a study is first made in the light of the experience of other Contracting Parties to establish that such re-introduction would be effective and acceptable."

(m) Convention on Migratory Species (CMS)

Article V provides guidelines for Agreements that indicate each Agreement should provide for but not be limited to a set of criteria including:

"Where it appears desirable, the provision of new habitats favourable to the migratory species or re-introduction of the migratory species into favourable habitats."

(n) Agreement on the Conservation of African-Eurasian Waterbirds (AEWA) and Action Plan (2005-2008)

Paragraph 2.4 of AEWA's Annex 3 (Action Plan) reads:

"Parties shall exercise the greatest care when re-establishing populations listed in Table 1 into parts of their traditional range where they no longer exist. They shall endeavour to develop and follow a detailed re-establishment plan based on appropriate scientific studies. Re-establishment plans should constitute an integral part of national and, where appropriate, international single species action plans. A re-establishment plan should include assessment of the impact on the environment and shall be made widely available. Parties shall inform the Agreement secretariat, in advance, of all re-establishment programmes for populations listed in Table 1."

(o) Central Asian Flyway Action Plan for the Conservation of Migratory Waterbirds and Their Habitats

Paragraph 2.5.1 of the Central Asian Flyway Action Plan requires that Range States exercise great care when executing re-establishment projects, develop detailed plans, include re-establishment in national and international action plans, and report all re-establishment projects to the UNEP/CMS Secretariat.

"Range States shall exercise the greatest care when re-establishing populations listed in Table 2 into parts of their traditional range where they no longer exist. They shall endeavour to develop and follow a detailed reestablishment plan based on appropriate scientific studies. Re-establishment plans should constitute an integral part of national and, where appropriate, international single species action plans. A re-establishment plan should include assessment of the impact on the environment and shall be made widely available. Range States shall inform the Secretariat, in advance, of all re-establishment programmes for populations listed in Table 2."

Content and specificity of re-establishment recommendations in ISSAPs

Close reading of the ISSAP re-establishment recommendations identified 14 individual components or specific requirements of the recommendations:

- 1 IUCN criteria should be met.
- 2 Birds should only be re-introduced to formerly occupied sites.
- 3 Measures should be taken to protect natural populations.
- 4 Previous threats should be identified and removed.
- 5 A monitoring plan should be designed.
- 6 A release strategy should be developed.
- 7 Collaborations with suitable partners should be sought.
- 8 A review of previous projects should be made.
- 9 Captive populations should be maintained.
- 10 Attention should be paid to the genetic makeup of birds to be re-introduced.
- 11 Sanitary control measures should be applied to captive populations.
- 12 An advisory expert group should be formed.
- 13 Timescale and/or priority should be indicated.
- 14 The area or region most appropriate for re-introduction should be specified.

The ISSAP recommendations differed widely in the number of components included (Table 3-2). The ISSAP for the Crested Coot (Gomez 1999) included the highest number of components (8), while the ISSAPs for the White-headed Duck (Hughes *et al.* 2006) and Ferruginous Duck (Callaghan 1997) included the lowest (2).

4 Meta-database for re-establishment projects

4.1 Objective

Set up a meta-database that contains relevant information on:

- those species for which re-establishment plans have been prepared (and implemented);
- those species for which re-establishments plans are under development; and
- those species for which re-establishment plans remain to be developed.

The past two decades have seen re-establishment receive increased attention as a conservation tool resulting in an increase in re-establishment projects worldwide (IUCN/SSC RSG 1995). As re-establishments are sometimes recommendations of action plans and other conservation initiatives it is vital that their occurrence, progress and outcomes are recorded (1) to inform future re-establishment projects for related species, and (2) to allow for the implementation of action plans and other conservation initiatives to be monitored.

The IUCN/SSC RSG recently began an ambitious project to create a database of all reestablishment projects worldwide. While there will be overlap between the IUCN/SSC RSG database and the AEWA re-establishment database, the AEWA database will focus equally on projects and recommendations, thus will include information not covered in the IUCN/SSC RSG database such as action plan recommendations and the progress of implementation in the relevant AEWA Range States.

4.2 Method

A meta-database of re-establishments was created using Microsoft Access. All relevant re-establishment data, gathered at other stages of this review, was added, including information on species, Range States, conservation initiatives, re-establishment projects, references, re-establishment contacts, and the data collected as part of the questionnaire review regarding IUCN re-introduction guidelines (see Section 5). Links to other species information databases, including the IUCN/SSC RSG database, were also included.

4.3 The AEWA re-establishment database

The meta-database currently contains the following information:

- Species (n=235)
 - Common name(s)
 - Scientific name
 - Family
 - IUCN Red List status (2007)
 - Link to species information in the AEWA information database
 - Link to species information in the UNEP-WCMC species database
 - Link to species information in the IUCN Red List database
 - Link to species and project information in the IUCN/SSC RSG database

Conservation initiatives (n=59)

- Name of conservation initiative
- Geographical scope
- Subject (one or more species)
- Year of publishing
- Publisher
- Author(s), editor(s) and/or compiler(s)
- Web link
- Reference

- Type (international action plan, national action plan, international convention or agreement, or other)
- For conservation initiatives with provisions on re-establishment, the relevant text from the initiative was included.

AEWA Range States (n=120)

- Name of Range State
- Region
- AEWA status
- Name(s) of National Focal Point(s)
- Contact details for National Focal Points

Re-establishment projects (n=47)

- Subject (common and scientific names)
- Type (re-introduction, re-stocking, feasibility study, etc)
- AEWA Range State
- Region
- Start year
- End year
- Name and role of a contact for the project
- Contact details for above
- Comments (including information about the number of birds released and the perceived success of the project)
- References

Re-establishment questionnaire returns (n=14)

- Date of return
- AEWA Range State
- Name and contact details of the respondent
- Project ID
- Questionnaire answers and comments

Re-establishment contacts (n=150)

- Name of contact person or group
- Contact details
- Area of expertise/knowledge
- Project involvement
- Group membership

Re-establishment references (n=72)

- Title of reference
- Author(s), editor(s) and/or compiler(s)
- Year of publishing
- Publisher
- Journal or book if applicable with volume and page details
- Web link
- Reference
- Description

Figures 4-1 and 4-2 illustrate the format of the AEWA re-establishment database.

Figure 4-1. Screenshot of the main entry page of the database created for reestablishment information relevant to AEWA.

Figure 4-2. Screenshot of the species information page for White-headed Duck Oxyura leucocephala in the database created for re-establishment information relevant to AEWA.

5 ASSESSMENT OF EXISTING WATERBIRD RE-ESTABLISHMENT PROJECTS AGAINST IUCN GUIDELINES

5.1 Objective

Assess re-establishment projects that have occurred for AEWA species in the AEWA region in terms of their compliance to IUCN re-introduction guidelines.

5.2 Method

To assess how closely waterbird re-establishment projects in the AEWA region have followed IUCN re-introduction guidelines, a questionnaire survey was conducted. Data gathered from the survey were analysed to determine how closely the projects had followed IUCN guidelines, how successful the projects had been and if there was a relationship between compliance and success.

Designing the questionnaire

The questionnaire was designed to address all of the relevant IUCN guidelines. The *IUCN/SSC Guidelines for Re-introductions* (IUCN/SSC RSG 1995) were broken-down into a list of 43 separate activities, organised under three project phases: pre-project activities; planning, preparation and release stages; and post-release activities. A question was included in the questionnaire to address each activity (Table 5-1). Thus, the questionnaire had 43 questions addressing IUCN guidelines. Of the 43 activities, 41 were requirements of the *IUCN/SSC Guidelines for Re-introductions* (IUCN/SSC RSG 1995) while two were simply suggestions.

Table 5-1. IUCN re-introduction guidelines and corresponding questions from the re-establishment questionnaire circulated as part of this review.

·		·				
IUCN re-introduction guidelines	Cor	Corresponding questions in questionnaire				
PRE-PROJECT ACTIVITIES						
a. BIOLOGICAL						
(i) Feasibility study and background research						
 Assessment of the taxonomic status of individuals to be re-introduced 	2-5	Was an assessment made of the taxonomic status of individuals to be re-introduced?				
 Investigation of historical information about the loss and fate of individuals from the re- introduction area 	2-13	Were the causes of decline identified?				
 Determination of critical needs 	2-4	Were the species' critical needs determined?				
 Population viability modelling including Population and Habitat Viability Analysis (ii) Previous re-introductions 	2-6	Was a Population and Habitat Viability Analysis conducted?				
- Research into prior re-introductions and	2-7	Was a review of re-introductions for similar species				
contact with relevant experts	- /	conducted?				
(iii) Choice of release site		conducted.				
- Site within historic range of the species	2-8	Was the release site within the historic range of the species?				
(Core or periphery)	2-9	Was the release site in the core or at the periphery of the historic range of the species?)				
- Assured, long-term protection	2-10	Did the release area have assured, long-term protection?				
(iv) Evaluation of re-introduction site						
 Habitat and landscape requirements of the species are satisfied and sustainable 	2-11	Was the habitat suitability of the release site assessed through scientific investigation?				
- Sufficient carrying capacity	2-12	Was there sufficient habitat at the release site to support a viable (self-sustaining) population in the long-term?				
 Identification and elimination, or reduction to a sufficient level, of previous causes of decline 	2-14	Were the causes of decline eliminated or reduced to a sufficient level?				
- Habitat restoration programme if necessary	2-15	Was a habitat restoration programme initiated before re-introduction?				
(v) Availability of suitable release stock						

IUCN re-introduction guidelines	Cori	esponding questions in questionnaire
- Source animals come from wild populations		Was the stock used captive or wild?
Stock must be guaranteed available on a regular and predictable basis		Was stock available on a regular and predictable basis?

be used, it must be from a population which has been soundly managed both demographically and genetically		was it from a population which had been soundly managed both demographically and genetically, according to the principles of contemporary conservation biology?
- Veterinary screening process	3-8	Was the health of the release stock monitored before release?
(vi) Release of captive stock		
- Individuals should be given the opportunity to acquire the necessary information to enable survival in the wild	3-21	Were birds acclimatised to local conditions before release?
b. SOCIO-ECONOMIC AND LEGAL REQUIREMENTS		
- Long-term financial support	2-21	Was there long-term financial support for the project?
- Long-term political support	2-22	Was there long-term political support for the project?
- Socio-economic studies	2-24	Were socio-economic studies conducted to assess impacts, costs, and benefits of the re-establishment programme to local human populations?
- Assessment of local attitudes	2-25	Was an assessment made of the attitudes of local people?
 Full understanding, acceptance and support of local communities 	2-26	Were local communities supportive of the re- introduction project?
 Policy of the country where the re- 	2-28	Was the country's re-introduction policy consulted?
introduction is to take place should be consulted		
 Permission and involvement of all relevant government agencies and land owners 	2-29	Did the project have permission of the relevant government agencies and land-owners?
PLANNING, PREPARATION AND RELEASE STA	GES	
 Construction of a multidisciplinary team with access to expert technical advice 	3-2	Was a multidisciplinary team of experts established?
 Identification of short-term success indicators 	3-3	Were short-term success indicators identified?
 Identification of long-term success indicators Prediction of programme duration 		Were long-term success indicators identified? Was the duration of the project predicted?
- Appropriate genetic screening		Was the release stock genetically screened?
 Appropriate health screening 	3-6	Was the release stock screened for disease?
- Appropriate veterinary care		Was veterinary support available?
- Determination of release strategy	3-10	Was a release strategy prepared?
- Public relations		Was there a public awareness programme associated with the project?
- Involvement of local people		Was there local community involvement?
- Interventions when necessary	3-23	Were there any human interventions, e.g. supplemental feeding?
POST-RELEASE ACTVIVITES	4 4	Weether and alexander 2
- Post-release monitoring	4-1	Was there post-release monitoring?
- Collection and investigation of mortalities	4-4	Was information collected on causes of mortality in released birds?
 Continued habitat protection or restoration where necessary 	4-5	Did habitat protection measures continue after re- introduction?
- Continued public relations	4-6	Were public relation activities continued after re- introduction?
- Evaluation of cost-effectiveness and success	4-2	Was there an evaluation of cost-effectiveness and/or re-introduction success?
- Publications in popular literature	4-7	Were the results published in popular literature?
- Publications in scientific literature	4-8	

In addition to the 43 questions addressing IUCN guidelines (Table 5-1), the questionnaire had nine questions addressing basic project information (species, Range State, etc) and six that could be used to indicate success (Table 5-2). Another 16 questions were

included to gather additional information such as the number of releases undertaken and the methods of post-release monitoring (see Appendix 2 for a complete questionnaire).

Table 5-2. Questions, from the re-establishment questionnaire, dealing with basic project information and success indicators.

(Deck & al. 1997)	wild? 4-1 Was there post-release monitoring?
	4-1 Was there post-release monitoring? 4-3 Please explain what criteria were used to determine success.

The questionnaire was produced in both Microsoft Excel and Microsoft Word formats. The Microsoft Excel version was designed so that it could be automatically analysed and uploaded into the AEWA re-establishment database.

Distribution of the questionnaire

The questionnaire was distributed to AEWA National Focal Points, re-establishment practitioners and other relevant experts. A total of 157 questionnaires were circulated: 120 to AEWA National Focal Points and 37 to re-establishment practitioners and other relevant experts. For National Focal Points with known e-mail addresses, the questionnaire was sent in Microsoft Excel format with an offer to provide a different format (e.g. Microsoft Word) if required.

Collation and analysis of data

Each questionnaire was reviewed to check the consistency of the answers. The questionnaire was designed to allow for cross-checking. Where answers were inconsistent between related questions or with accompanying comments, minor adjustments were made to improve the consistency, and thus the validity of later analysis. In some questionnaires, answers were left blank that were readily available in literature; these answers were supplemented.

The reviewed questionnaires were then run through a series of procedures in Microsoft Excel to extract the necessary data, calculate each project's level of compliance to IUCN re-introduction guidelines ('IUCN compliance score') and calculate each project's level of success ('success rating').

Calculation of the IUCN compliance scores

Using an automated Microsoft Excel procedure on the questionnaire data, each reestablishment project was scored regarding its level of compliance at each of the three re-introduction phases (pre-project; planning, preparation and release; and post-release) and overall.

Scores were calculated by awarding points for each guideline followed. Each of the 41 required activities from the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) (Table 5-1) was weighted equally. Equal weights were chosen to ensure that the analysis would indicate overall compliance, and not indicate compliance to particular guidelines that are assumed to be more important or have been shown to be more important in past studies.

Each answer to a question that addressed a required activity was scored from 0 to 4: full compliance was awarded 4 points, partial compliance was awarded 1 to 3 points and no compliance was awarded 0 points (Table 5-3).

Two scores were awarded in addition to the required activity scores: one point for releasing birds into the core of a historical range as opposed to at the periphery; and one point for using wild release stock rather than captive (Table 5-3). These two activities were included because, while they are not required activities, they are suggestions of the *IUCN Guidelines for Re-introductions*.

^{*} Q = question number in re-establishment questionnaire addressing the relevant guideline.

The maximum possible score was 166: 102 for pre-project activities; 40 for planning, preparation and release stages; and 24 for post-release activities. Unanswered questions were not scored with 0 points but were left out of score calculations. Final scores were converted to percentages for each project phase (pre-project activities; planning, preparation and release stages; and post-release activities) and for the project overall.

Calculating the success ratings

Project success was evaluated using six standard criteria assessed in the questionnaire:

- 1. The number of birds successfully released from captivity or translocated from a wild population.
- 2. The survival rate of released birds.
- 3. The extent of breeding of the re-introduced population.
- 4. The growth rate of the re-introduced population.
- 5. How successful the practitioners rated their own project (i.e. if short and/or long-term goals were achieved).
- 6. Whether or not a self-sustaining population of more than 500 individuals was established (Beck *et al.* 1994).

The criteria were chosen based on past reviews of re-introduction success (Ostermann *et al.* 2001, Beck *et al.* 1994). The first criterion is an indicator of the quality of the captive-breeding techniques and conditions, and/or the methods of translocation from the wild. Criteria 2-4 are indices of the released birds' ability to contribute to the wild population. The fifth criterion is an indicator of the success of the project in relation to the individual project goals. The sixth criterion is a measure of long-term success.

Each criterion was the subject of one or more questions in the re-establishment questionnaire. Some four of the six criteria required categorical answers that could be scored from 0 to 2 (Table 5-4). The remaining two criteria, growth rate and self-sustaining population of over 500 individuals, were determined by evaluating the answers to four questions (Table 5-4) on survival, breeding, project outcomes and post-release monitoring. Growth rate could be scored from 0 to 2, and self-sustaining population from 0 to 1 (Table 5-4).

The maximum score achievable was 11 and the minimum 0. If a questionnaire was submitted without answers to all of the success criteria questions, missing answers were extrapolated from other answers and additional sources of information.

Table 5-4. Scoring system for re-introduction success.

Success criteria	Question(s)	Answers aligned with corresponding scor		
		0	1	2
1 Number of birds released	3-18	≤10	11-50	>50
2 Survival of released birds	3-24	≤50%	51-80%	>80%
3 Extent of breeding of the released birds	3-25	None	To some extent	To great extent
4 Growth rate of the re-introduced population	3-24, 3-25, 4-1 & 4-3	No growth	Less than doubled	More than doubled
5 How successful the practitioners rated their own project (i.e. if short and/or long-term goals were achieved)	4-2-2	No	Partly	Yes
6 Whether or not a self-sustaining population of more than 500 individuals was established (Beck <i>et al.</i> 1994)	3-24, 3-25, 4-1 & 4-3	No	Yes	

Comparison of IUCN compliance scores with success ratings

To assess the relationship between the calculated IUCN compliance scores and success ratings, a regression analysis was performed.

5.3 Results

Questionnaire returns

Of the 157 circulated, 11 questionnaires were completed and returned, and an additional three questionnaires were completed by literature review (Table 5-5).

Table 5-5. List of the projects for which questionnaires were completed.

13 PurSwa IT	Purple Swamphen Porphyrio porphyrio	Italy	Alessandro Andreotti (INFS)
14 WatCra ZA	Wattled Crane Grus carunculatus	South Africa	Jeanne Marie Pittman (Johannesburg Zoo)

Unfortunately, four of the returned questionnaires could not be included in further analysis: the re-introduction of Caribbean Flamingo *Phoenicopterus ruber* (CarFla BVI) was excluded because it did not occur in an AEWA Range State; a supplementation of Wattled Crane *Grus carunculatus* (WatCra ZA) was excluded because it did not meet the criteria of a re-establishment project; a re-introduction of Purple Swamphen *Porphyrio porphyrio* in Italy (PurSwa IT) was excluded because the Purple Swamphen is not an AEWA species; and a project to re-introduce Dalmatian Pelican *Pelecanus crispus* in Croatia (DalPel CR) was excluded because the project was in planning stages when the questionnaire was completed.

See Appendix 2 for the completed questionnaires.

IUCN compliance scores

The overall IUCN compliance scores ranged from 23% for a re-introduction of the Whiteheaded Duck in Hungary to 88% for a re-introduction of the Corn Crake in the United Kingdom (Table 5-6).

Table 5-6. Scores for compliance to IUCN re-introduction guidelines for 10 re-establishment projects for waterbird species covered by AEWA.

Project	Pre-project activities*	Planning, preparation and release stages*	Post-release activities*	All stages*
1 White-headed Duck – Hungary	28%	11%	30%	23%
2 Greylag Goose – Belgium	40%	33%	90%	51%
3 White Stork - Belgium	60%	35%	58%	50%
4 Ferruginous Duck - Spain	69%	10%	20%	46%
5 White-headed Duck – Spain (mainland)	79%	63%	60%	71%
6 White-headed Duck - Spain (Majorca)	60%	25%	80%	61%
7 Corn Crake – United Kingdom	88%	90%	83%	88%
8 Lesser White-fronted Goose - Finland	64%	80%	60%	66%
9 White-headed Duck - Italy	58%	72%	10%	55%
10 White Stork - The Netherlands	55%	56%	83%	61%

^{*}See Methods section for explanation of calculations and rationale.

Success ratings

The calculated success ratings ranged from 1 for the re-introduction of White-headed Duck in Italy that did not result in a self-sustaining population to 9 for the re-introduction of White-headed Duck in Spain (mainland) that did result in a self-sustaining population (Table 5-7).

Table 5-7. The success criteria, success ratings and outcomes of 10 re-establishment projects for waterbird species covered by AEWA.

	•							
Project	Number of birds released	Survival	Breeding	Population growth	Self-rated successful	Self-sustaining population of ≥500	Success rating (/11) *	Outcome of project
1 White-headed Duck Hungary	Unknown but > 52	0 - 10%	None	None	No	No	7	A self-sustaining population was not attained - ended in 1992.
2 Greylag Goose Belgium	3 pairs	Unknown	To great extent	Unknown (pop >700 pairs)	Yes	No	4	Unknown.
3 White Stork Belgium	Unknown but > 150	41-50%	To some extent	Unknown (pop. estimated at 65 pairs)	Not rated	No	m	<65 pairs largely limited to compounds.
4 Ferruginous Duck Spain	100	Unknown	To some extent	Less than doubled	Not rated	N _O	ro.	Small numbers of breeding birds.
5 White-headed Duck Spain (mainland)	Unknown	61-70%	To some extent	More than doubled	Yes	Yes	6	A wild population of >1200 birds – exact contribution of re-introduction unknown.
6 White-headed Duck Spain (Majorca)	56	31-40%	To some extent	None	ON O	No	4	68% of birds disappeared within a year.
7 Corn Crake United Kingdom	291	81-90%	To some extent	Less than doubled	Partly	O _N	7	Progress toward the establishment of a stable population of >30 pairs - birds have returned from overwinter migration and bred in the wild.
8 Lesser White-fronted Goose Finland	Not reported but ~150	< 50%	Unknown	Unknown (probably minimal)	Not rated	No	4	Few details given – project said to be in preliminary stages
9 White-headed Duck Italy	15	0 - 10%	None	None	Not rated	No		Poor captive breeding success and high mortality of re-introduced birds.
10 White Stork The Netherlands	Unknown but >50	11-20%	To great extent	More than doubled	Yes	No (> 500 pairs but dependent on intervention)	8	In 2007, there were more than 600 pairs

^{*} See Methods section for explanation of calculations and rationale.

Comparison of IUCN compliance scores with success ratings

Regression analysis showed a positive relationship between the IUCN compliance scores and the success ratings that approached significance (F=5.05, r^2 =0.387, p=0.055, n=10) (Figure 5-1). The project that received the second lowest success rating (2) showed the least amount of compliance with IUCN guidelines (23%), while the three projects that received the highest success ratings (7, 8 and 9) showed the highest amounts of compliance (88%, 61% and 71%, respectively) with the exception of the Lesser White-fronted Goose project which scored 66% for compliance but achieved a success rating of only 4 (Figure 5-1). If the data for the Caribbean Flamingo and Purple Swamphen projects were included the relationship was significant (F=10.97, r^2 =0.523, p<0.01, n=12).

Figure 5-1. Relationship between the compliance to IUCN guidelines scores and the success ratings for 10 re-establishment projects for AEWA waterbird species in AEWA Range States (y=-0.67+9.39x, F=5.05, $r^2=0.387$, p=0.055, n=10).

6 PROGRESS IN IMPLEMENTING RE-ESTABLISHMENT PROJECTS

6.1 Objective

Assess the status of and progress in the implementation of re-establishment projects by Range States and other stakeholders.

6.2 Method

To assess the status of and progress in the implementation of re-establishment projects, a list of 'species of interest' (Table 6-1) was compiled based on 3 criteria: (1) the 2007 IUCN Red List Status of Vulnerable (VU), Endangered (EN), or Critically Endangered (CR) – these species were classed as threatened; (2) an international single species action plan (ISSAP) existing for the species; or (3) the completion or planning of at least one re-establishment project.

As stated, criterion 1 was assessed using the IUCN Red List (2007). The information required to assess criterion 2 was provided in Section 2 of this review, and the information required to assess criterion 3 was gathered by searching scientific literature, popular literature and websites, and by consulting National Focal Points and other relevant ornithological experts.

These criteria ensured that the list included all threatened species, all species with ISSAPs, and all species for which re-establishment projects had been completed or planned.

The 'species of interest' were divided into three groups: species with ISSAPs that recommended re-establishment; species with ISSAPs that did not recommend re-establishment; and species without ISSAPs. The proportions of species for which re-establishment projects had been implemented were determined within these groups.

6.3 Results

A total of 38 'species of interest' were identified. Of these, 21 were considered threatened, five had had re-establishment recommended in an ISSAP as a conservation measure, and 15 were the subjects of observed (past or current) or expected (planned/future) re-establishment projects (Table 6-1).

Table 6-1. Species of interest based on IUCN Red List Status, existence of an international single species action plan (ISSAP) or existence of a reestablishment project (observed or expected).

AEWA waterbird species	ISSAP	IUCN Red List Status (2007)* ²⁷	Re-est rec**?	Number of projects (observed*)	Number of projects (expected*)

White-winged Crake Sarothrura ayresi	No	EN	No	0	0

^{*} CR = critically endangered, EN = endangered, VU = vulnerable, NT = near threatened, LC = least concern, observed = completed or ongoing, expected = planned for future.

Of the 21 species with ISSAPs, five have been recommended for re-establishment. Of these, re-establishment projects have been implemented for both of the two threatened species (Lesser White-fronted Goose and White-headed Duck) and for two out of three of the non-threatened species (Ferruginous Duck and Crested Coot) (Table 6-1). The only species where re-establishment has not been implemented despite a recommendation is the Maccoa Duck.

Of the remaining 214 waterbird species covered by AEWA, re-establishment projects have been conducted for two threatened species and four non-threatened species (Table 6-2). Thus, re-establishments have been conducted for 33% of the threatened species and for 3% of the non-threatened species (Table 6-2).

45

^{**} re-est rec = re-establishment recommended in an ISSAP (i.e. not a national action plan).

>> Multiple re-introductions and introductions (including supplementations for hunting purposes) in at least seven European countries.

²⁷ Source: IUCN. 2007. 2007 IUCN Red List of Threatened Species. <www.iucnredlist.org>.

Table 6-2. Numbers of re-establishment projects observed and expected for groups of waterbird species covered by AEWA - species were grouped according to their status, the existence of an ISSAP and whether or not that ISSAP recommended re-establishment.

Species group	Number of species	Number of species with re-establishment projects (%)		Number of projects (observed*)	Number of projects (expected*)
Species with an ISSAP					
recommending re-establishment	5	4	(80%)	32	2
Threatened	2	2	(100%)	7	2
Non-threatened	3	2	(66%)	25	0
Species with an ISSAP not					
recommending re-establishment	16	3	(19%)	7	1
Threatened	7	2	(29%)	6	1
Non-threatened	9	1	(11%)	1	0
Species without an ISSAP	214	6	(3%)	>>12	1
Threatened	12	2	(17%)	2	0
Non-threatened	202	4	(2%)	>>10	1
All	235	14	(6%)	>>50	4
Threatened	21	6	(33%)	15	3
Non-threatened	214	7	`(3%)	>>36	1

^{*} observed = completed or ongoing, expected = planned for future.

The group with the highest proportion of species with re-establishment projects was the group containing species with ISSAPs recommending re-establishment (80%); second was the group containing species with ISSAPs not recommending re-establishment (19%); and the group with the lowest proportion was the group containing species without ISSAPs (3%) (Table 6-2).

Within each of these groups, the proportion of species with re-establishment projects was $\geq 15\%$ higher for threatened species compared with non-threatened species (Table 6-2, Figure 6-1).

>> Total number is unknown but significantly higher than stated.

Figure 6-1. Percentage of species for which re-establishment projects have been implemented.

7 IMPROVING THE EFFECTIVENESS OF RE-ESTABLISHMENT AS A CONSERVATION MEASURE

7.1 Objective

Assess the effectiveness of waterbird re-establishment projects in the AEWA region and determine the factors that are most linked to success in these projects.

7.2 Method

Using data gathered during the questionnaire survey (Section 5), an assessment was made of the key factors influencing the success or failure of the projects for which questionnaires were returned.

Projects were defined as 'successful' or 'unsuccessful' based on the success ratings calculated in Section 5 of this review and whether or not a stable population is thought to have resulted.

The key factors identified by practitioners as influencing success or failure were extracted from the questionnaires, and the answers to a selection of questions were compared to determine which factors were common to the successful projects versus the unsuccessful projects. The findings from these 2 procedures were combined into a master list of key factors influencing success.

7.3 Results

Of the 10 projects reviewed by questionnaire, two achieved stable populations (Table 7-1): the re-introduction of the White-headed Duck in mainland Spain and the re-introduction of White Stork in the Netherlands. These projects also received the highest success ratings, 8 and 9, respectively. Based on these two facts the projects were deemed successful. The re-introduction of Corn Crake in the United Kingdom was also considered successful. While a stable population has not yet been established, the project is on-going, has met its intermediate targets and received the third highest success rating, 7. Thus 30% of the projects reviewed were considered successful. Past reviews of re-establishment have found a much lower success rate. Beck $et\ al.\ (1994)$ found evidence that only 16 (11%) of 145 re-introduction projects were successful, with success defined as establishment of a wild population of ≥ 500 individuals free of human support, or population viability as determined by a formal genetic-demographic analysis.

Table 7-1 presents the key factors that practitioners viewed as influencing success or failure for their own projects. Acclimatization of birds pre-release was mentioned three times as a key factor in success and a lack of acclimatization was mentioned once as a key factor in failure. Quality of habitat (relating to protection, management or regeneration) is mentioned three times as a key factor in success.

Table 7-1. Key factors relating to success or failure in 10 re-establishment projects for waterbird species covered by AEWA.

Project	Key factors relating to success	Key factors relating to failure	Outcome of project
1 White-headed Duck Hungary			A self-sustaining population could not be attained - the project was stopped in 1992
2 Greylag Goose Belgium	- Birds were initially released into a park with captive waterbirds	- The introduced birds came from Russia and belonged to a subspecies (<i>Anser</i> anser rubirostris) not native to the area	A breeding population of >700 pairs of a non-native subspecies – impact of project on this population unknown.
3 White Stork Belgium			<65 pairs largely limited to compounds
4 Ferruginous Duck Spain	 Habitat regeneration Good acclimatization of birds before release 		Small numbers of breeding birds
5 White-headed Duck Spain (mainland)	- Released birds were juveniles - Captive breeding occurring within the release area - Condition of the released birds (healthy and untamed)		A wild population of >1,200 birds
6 White-headed Duck Spain (Majorca)	- Release area is well protected and guarded	The first release failed because birds were not acclimatised The second release failed because too few birds were released	68% of birds disappeared within a year
7 Corn Crake United Kingdom	 In-depth understanding of the species' critical needs Reserve management sympathetic to needs of the released birds 		Progress toward the establishment of a stable population of >30 pairs - birds have returned from overwinter migration and bred in the wild.
8 Lesser White-fronted Goose		 No financial support from official sources Poor political support at the national level 	Few details given – project said to be in preliminary stages.
9 White-headed Duck Italy		- Causes of decline not eliminated - Problems rearing birds in captivity - Assessment of reasons for failure pending	Poor captive breeding success and high mortality of re-introduced birds forced a stop to releases.
10 White Stork The Netherlands	- Team were passionate about and dedicated to the project		In 1969, the White Stork was considered extinct in the Netherlands; in 2007, there were over 600 pairs.

Table 7-2 compares the characteristics of the projects considered to be successful and those considered to be unsuccessful. Successful projects eliminated or reduced the causes of decline, had long-term financial and political support, identified success indicators, acclimatised birds to their release areas and monitored the birds post-release. Of the three successful projects, two conducted feasibility studies, one released birds at the core of their historical range, and two had support from local communities.

In common with the successful projects, the majority of unsuccessful projects also reduced sufficiently the causes of decline, monitored birds post-release and acclimatised birds to their release areas.

The factors that differ between successful and unsuccessful projects are long-term financial and political support and the identification of success indicators. Of the three successful projects, two reported having both long-term financial and long-term political

support while the other reported having partial long-term financial support; in comparison, only one unsuccessful project reported having either. Finally each successful project reported identifying short and long-term success indicators. Again something only one unsuccessful project reported.

Table 7-2. Characteristics of successful and unsuccessful projects for AEWA waterbird species (successful projects are shaded).

Factor	Projects (numbers correspond projects in Table 7-1)

- 7 Corn Crake United Kingdom
- 8 Lesser White-fronted Goose Finland
- 9 White-headed Duck Italy
- 10 White Stork the Netherlands

Considering the key factors identified by re-introduction practitioners and the factors found common to successful projects and uncommon to unsuccessful projects, the following activities are considered especially crucial to the success of waterbird reestablishment projects:

- Completion of a comprehensive feasibility study.
- Pre-release acclimatization of birds to their release area.
- Good quality habitat with the original causes of decline eliminated or reduced.
- Long-term financial and political support.
- Identification of short and long-term indicators of success.

^{**} Elim = eliminated; suff = sufficiently; some = somewhat.

[†] The answers to the questions addressing these factors did not match accompanying comments – comments were given priority.

8 RECOMMENDATIONS AND IMPROVEMENTS NEEDED

This report has identified three major areas for improvement regarding re-establishment projects: (1) the success rate of re-establishment projects; (2) the reporting on re-establishment projects; and (3) the evaluation of re-establishment projects.

Evaluating the success of a re-establishment project is a complex process and a variety of factors must be considered. Of the projects assessed as part of this report, only three were considered successful. Past reviews of re-establishment have also found low success rates. Beck *et al.* (1994) found evidence that only 16 (11%) of 145 re-introduction projects were successful with a wild population of \geq 500 individuals established.

In an attempt to improve success, the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) were published in 1995 providing specific policy guidelines for reestablishment projects. Compliance with these guidelines appears to be associated with higher success for waterbird species re-establishment projects. However, the IUCN guidelines were written to encompass the full range of plant and animal taxa and are therefore general. The guidelines are focused on re-establishment projects using captive-bred individuals and toward re-establishment projects of globally threatened species with a limited numbers of founders (IUCN/SSC RSG 1995). For these reasons, guidelines for re-introducing individual species or groups of species should be developed in future.

In addition to guidelines, networks or groups of experts with knowledge relevant to reestablishments of a specific species should be assembled. An example of such a group is the International Advisory Group on the Northern Bald Ibis (IAGNBI). This group was created to ensure international co-ordination and co-operation on Bald Ibis projects. Through regular workshops and newsletters, the group aims to produce release guidelines for the Bald Ibis and review propositions for all Bald Ibis re-introduction projects (Boehm *et al.* 2003).

In order to improve the success rate of re-establishment projects, this report recommends that:

- 1. Re-establishment projects are conducted in strict accordance with the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995).
- 2. The *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) are adapted for waterbird species and supplemented with checklists of activities for practitioners to complete.
- 3. The IUCN/SSC Re-introduction Specialist Group (IUCN/SSC RSG) is consulted prior to any re-establishment project to provide best practice guidance, expertise and a list of relevant contacts for the species to be re-established. Consultations should be made before a feasibility study or any planning has been initiated.
- 4. Re-establishment projects are conducted by groups of organisations and experts with diverse skills bases. Collaboration will bring a number of significant advantages: enhanced expertise, transfer of skills, shared responsibility, shared accountability and increased funding opportunities.
- 5. **Networks or groups of experts with knowledge relevant to re- establishments of a specific species are assembled** to act as advisory groups for re-establishment projects of the relevant species. These should be assembled for those species for which re-establishment has been recommended and for those species for which re-establishment projects are currently occurring or being planned. It may be appropriate for these species-specific groups to be formed within the IUCN/SSC RSG.

As part of this report, IUCN re-introduction guidelines were evaluated to determine which are most associated with success. While this report recommends that all guidelines be followed (see recommendation 1 above), it also recommends that particular attention be paid to those guidelines most associated with success for waterbird re-establishment projects. Thus, this report recommends that:

- 6. During pre-project activities, particular attention is paid to the following:
 - Completing a comprehensive feasibility study, comprising an
 assessment against IUCN re-introduction criteria, a review of historic
 status, an assessment of the species critical needs, a scientific
 assessment of habitat suitability of the release site, and a Population and
 Habitat Viability Analysis to determine the number of birds that need to be
 released to establish a sustainable population.
 - Securing long-term financial and political support.
- 7. During re-introduction activities, particular attention is paid to the following:
 - **Ensuring birds are acclimatized** to their release area prior to release.
 - Ensuring a sufficient amount of good quality habitat is available where the original causes of decline have been eliminated or sufficiently reduced.
 - Identifying short and long-term indicators of success.

Although the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) suggest an assessment phase, in which the experiences and results of projects are regularly evaluated, published results remain scarce (Ostermann *et al.* 2001). In 1994, less than half of the projects known to have re-introduced animals had produced assessment information (Beck *et al.* 1994). As part of this review, information was provided for only 11 waterbird species re-establishment projects despite over 60 projects having occurred in the AEWA region. This lack of information on re-establishment projects could be in part attributed to the lack of national and international monitoring schemes and a reluctance to report failures. The paucity of information causes difficulties with the evaluation and refinement of re-establishment methods and techniques, thus it is vital that reporting is improved.

In order to inform the triennial up-dates of this review and provide the data necessary to maintain the AEWA re-establishment database, this report recommends that:

8. **AEWA National Focus Points maintain a national register** of reestablishment projects occurring or planned to occur wholly or in part within their corresponding Ranges States. This recommendation is in line with paragraph 2.4 of the AEWA Action Plan requiring Contracting Parties to "inform the Agreement secretariat, in advance, of all re-establishment programmes for populations listed in Table 1."

In order to improve the amount and quality of data available on re-establishment methodologies, this report recommends that:

All re-establishment projects are described to the IUCN/SSC RSG. A
reporting structure should be developed to encourage practitioners to provide
detailed information about each project stage. The IUCN/SSC RSG should make
this information widely available and accessible.

In order to monitor the implementation of relevant action plans and other conservation initiatives within the AEWA region, this report recommends that:

10. **The AEWA re-establishment database is maintained** with up to date information, on re-establishment projects and recommendations, supplied by Contracting Parties as per recommendation 8 of this report.

Despite the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) providing detailed guidelines for implementing re-establishment projects, a standard set of evaluation criteria does not exist. Standard criteria specifically for evaluating waterbird re-establishment projects would allow for more informative project assessments and provide guidance for standardised reporting, which would in turn generate recommendations for improving project success (Ostermann *et al.* 2001; Stanley Price 1991; Beck *et al.* 1994).

In order to improve the evaluation of re-establishment projects this report recommends that:

11. A standard set of evaluation criteria for waterbird re-establishment projects is developed by the AEWA Technical Committee in liaison and consultation with appropriate experts and reported to AEWA Contracting Parties as soon as is possible, as well as being included within the next, triennial update of this review (for the fifth Meeting of Parties in 2011).

9 CONCLUSIONS

Species for which re-establishments are needed

Re-establishment has been recommended as a conservation measure for six waterbird species in international and national actions plans published since 1995: Lesser White-fronted Goose (Madsen 1996), Ferruginous Duck (Callaghan 1997), Crested Coot (Gomez 1999), White-headed Duck (Hughes *et al.* 2006), Maccoa Duck (Abebe *et al.* 2007), and Corn Crake (UKBAP 1995b). A variety of projects have been undertaken to fulfil these recommendations.

Lesser White-fronted Goose Anser erythropus

Re-establishment was recommended in the 1996 *International Action Plan for the Lesser White-fronted Goose Anser erythropus* (Madsen 1996) for areas where the species had disappeared and other conservation measures had failed. However the second draft of the 2006 *International Action Plan for the Lesser White-fronted Goose Anser erythropus* (Jones 2006) does not make such a recommendation and concludes that there is no consensus among Lesser White-fronted Goose stakeholders on the use of captive breeding and re-introduction/ restocking as valid conservation tools. In the 1980s, 2 projects to re-introduce this species were implemented: one in Sweden and the other in Finland. The re-introduced Swedish population is migrating along a route not used by native birds. The Finnish project is reported to have had highlevels of mortality and little breeding success. A new German-based project plans to release 400 captive-bred Lesser White-fronted Geese in Lapland and induce migration to the Lower Rhine area of Germany.

Ferruginous Duck Aythya nyroca

Re-establishment was recommended in the 1997 *European Species Action Plan Ferruginous Duck Aythya nyroca* (Callaghan 1997) as a last measure conservation strategy to re-introduce the species to areas of its former range. However, reestablishment was not a recommendation of the 2006 *International Single Species Action Plan for the Conservation of the Ferruginous Duck Aythya nyroca* (Robinson & Hughes 2006). Over 23 re-introduction projects have been implemented in France, Spain and Italy with little success, apart from 2 projects in Italy that have reportedly produced self-sustaining populations.

Crested Coot Fulica cristata

Maintaining a captive breeding population of this species was considered of medium priority in the 1999 *International Species Action Plan Crested Coot Fulica cristata* (Gomez 1999). The action plan required that a re-introduction programme following IUCN guidelines should be implemented in Spain between the Andalucía and Valencia Regions with a total of 50 pairs re-introduced. Re-introductions of Crested Coot have occurred in both the Andalucía and Valencia regions – the outcomes of these projects are unknown.

White-headed Duck Oxyura leucocephala

Re-establishment was recommended in the 2006 *International Single Species Action Plan for the Conservation of the White-headed Duck Oxyura leucocephala* (Hughes *et al.* 2006). The action plan recommended that the species should be re-introduced to formerly occupied sites, if IUCN criteria can be met. A number of re-introductions of this species have occurred with varying success. Projects in France, Hungary and Italy have failed to achieve self-sustaining populations. Of the 2 known projects occurring in Spain, 1 is reported to have established a self-sustaining population, of over 1,200 birds.

Maccoa Duck Oxyura maccoa

Re-establishment was recommended in the 2007 *International Single Species Action Plan for the Conservation of the Maccoa Duck Oxyura maccoa* (Abebe *et al.* 2006) for suitable sites in southern Tanzania. This measure was considered of medium

importance for the conservation of this species. No known re-establishment projects have been implemented for the Maccoa Duck.

Corn Crake Crex crex

Re-establishment was recommended in the 1995 *UK Biodiversity Action Plan – Corn Crake Crex crex* (UKBAP 1995b) as a long-term conservation measure to re-establish the species in parts of its former range in the United Kingdom. A project to reintroduce Corn Crake in England began in 2000 and is ongoing – 291 birds were released between 2002 and 2006 and breeding has been reported.

Waterbird conservation initiatives requiring re-establishment

Re-establishment can be a recommendation of a variety of conservation initiatives including national and international action plans, international conventions and agreements, and conservation assessment and management plans. Of the 59 initiatives reviewed for this report, 15 had provisions on re-establishment:

- 1. Action Plan for the Dalmatian Pelican (*Pelecanus crispus*) in Europe (Crivelli 1996).
- 2. Agreement on the Conservation of African-Eurasian Migratory Waterbirds (AEWA) and Action Plan (2005-2008).
- 3. Central Asian Flyway Action Plan for the Conservation of Migratory Waterbirds and their Habitats.
- 4. Convention on Migratory Species (CMS).
- 5. Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention).
- 6. Cranes Status survey and conservation action plan (Meine & Archibald 1996).
- 7. Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora.
- 8. European Species Action Plan Ferruginous Duck Aythya nyroca (Callaghan 1997).
- 9. International Action Plan for the Lesser White-fronted Goose *Anser erythropus* (Madsen 1996).
- 10. International Single Species Action Plan for the Conservation of the White-headed Duck *Oxyura leucocephala* (Hughes *et al.* 2006).
- 11. International Single Species Action Plan for the Conservation of the Maccoa Duck Oxyura maccoa (Abebe et al. 2007).
- 12. International Species Action Plan Crested Coot Fulica cristata (Gomez 1999).
- 13. Pan-European Biological and Landscape Diversity Strategy.
- 14. Penguin conservation assessment and management plan (CAMP): report from the workshop held 8-9 September 1996, Cape Town, South Africa (Ellis *et al.* 1998).
- 15. UK Biodiversity Action Plan Corn Crake Crex crex (UKBAP 1995b).

The recommendations in the ISSAPs included in this list differed widely in the level of detail given about the recommended re-establishments. Some discussed a wide range of requirements, such as the maintenance of genetically variable captive populations and the formation of expert advisory groups, while others said little more than that reestablishments should be attempted in previously occupied areas if IUCN criteria can be met. Standardising re-establishment recommendations in future action plans should be considered.

Meta-database of re-establishment projects

The AEWA re-establishment database is a potentially web-accessible central data repository for information about re-establishments of waterbird species covered by AEWA. The AEWA re-establishment database currently incorporates relevant information on species, Range States, conservation initiatives, re-establishment projects, references, re-establishment contacts, and the data collected as part of the questionnaire review regarding IUCN re-introduction guidelines. The database also includes links to other species information databases.

Assessment of existing waterbird re-establishment projects against IUCN guidelines

The compliance of re-establishment projects to IUCN guidelines was found to vary between 23% for a White-headed Duck re-introduction in Hungary and 88% for a Corn Crake re-introduction in the United Kingdom. Of the 10 projects assessed by questionnaire, three were deemed successful based on a variety of criteria: the re-introduction of Corn Crake in the United Kingdom, the re-introduction of White Stork in the Netherlands, and the re-introduction of White-headed Duck in mainland Spain. These three projects received IUCN compliance scores of 88%, 61% and 71%, respectively. The seven projects deemed unsuccessful all received IUCN compliance scores of 61% or less with the exception of the re-introduction of Lesser White-fronted Geese, which scored 66%. When compliance scores were compared with success ratings, there was a positive relationship between IUCN compliance and success. This relationship did not achieve statistical significance but approached significance, and if additional data were included the relationship was significant. Thus, projects that show greater compliance to IUCN re-introduction guidelines seem to achieve higher levels of success.

Progress in implementing re-establishment projects

Re-establishment projects have been implemented for four of the five species for which re-establishment has been recommended in an ISSAP. The only species where re-establishment has not been implemented despite a recommendation is the Maccoa Duck.

Of the remaining 230 waterbird species covered by AEWA, re-establishment projects have been conducted for four threatened species and five non-threatened species. Thus, re-establishments have been conducted for 33% of the threatened species and for 3% of the non-threatened species covered by AEWA.

Improving the effectiveness of re-establishment as a conservation measure

A number of factors were identified as relating to success. In the questionnaire survey, practitioners most commonly identified pre-release acclimatization of released birds and quality of habitat as key factors influencing success. Further assessment of questionnaire results relating compliance to IUCN guidelines and success, revealed a number of factors common to successful projects but uncommon to unsuccessful projects: long-term financial support, long-term political support and the identification of both short and long-term success indicators.

Considering both the factors identified by re-introduction practitioners and the factors linked to success in the questionnaire assessment, the following activities are considered especially crucial to waterbird re-establishment success:

- Completion of a comprehensive feasibility study.
- Pre-release acclimatization of birds to their release area.
- Good quality habitat with the original causes of decline eliminated or reduced.
- Long-term financial and political support.
- Identification of short and long-term indicators of success.

Recommendations and improvements needed

In order to improve the success of re-establishment as a conservation tool for waterbird species this report recommends that:

- 1. Re-establishment projects are conducted in strict accordance with the *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995).
- 2. The *IUCN Guidelines for Re-introductions* (IUCN/SSC RSG 1995) are adapted for waterbird species and supplemented with checklists of activities for practitioners to complete.
- 3. The IUCN/SSC Re-introduction Specialist Group (IUCN/SSC RSG) is consulted prior to any re-establishment project to provide best practice guidance, expertise and a list of relevant contacts for the species to be re-established. Consultations should be made before a feasibility study or any planning has been initiated.
- 4. Re-establishment projects are conducted by groups of organisations and experts with diverse skills bases. Collaboration will bring a number of significant advantages: enhanced expertise, transfer of skills, shared responsibility, shared accountability and increased funding opportunities.
- 5. Networks or groups of experts with knowledge relevant to re-establishments of a specific species are assembled to act as advisory groups for re-establishment projects of the relevant species. These should be assembled for those species for which re-establishment has been recommended and for those species for which re-establishment projects are currently occurring or being planned. It may be appropriate for these species-specific groups to be formed within the IUCN/SSC RSG.
- 6. During pre-project activities, particular attention is paid to the following:
 - Completing a comprehensive feasibility study, comprising an assessment against IUCN re-introduction criteria, a review of historic status, an assessment of the species critical needs, a scientific assessment of habitat suitability of the release site, and a Population and Habitat Viability Analysis to determine the number of birds that need to be released to establish a sustainable population.
 - Securing long-term financial and political support.
- 7. During re-introduction activities, particular attention is paid to the following:
 - Ensuring birds are acclimatized to their release area prior to release.
 - Ensuring a sufficient amount of good quality habitat is available where the original causes of decline have been eliminated or sufficiently reduced.
 - Identifying short and long-term indicators of success.

- 8. AEWA National Focus Points maintain a national register of re-establishment projects occurring or planned to occur wholly or in part within their Ranges States. This recommendation is in line with paragraph 2.4 of the AEWA Action Plan requiring Contracting Parties to "inform the Agreement secretariat, in advance, of all re-establishment programmes for populations listed in Table 1."
- 9. All re-establishment projects are described to the IUCN/SSC RSG. A reporting structure should be developed to encourage practitioners to provide detailed information about each project stage. The IUCN/SSC RSG should make this information widely available and accessible.
- 10. The AEWA re-establishment database is maintained with up to date information, on re-establishment projects and recommendations, supplied by Contracting Parties as per recommendation 8 of this report.
- 11. A standard set of evaluation criteria for waterbird re-establishment projects is developed by the AEWA Technical Committee in liaison and consultation with appropriate experts and reported to AEWA Contracting Parties as soon as is possible, as well as being included within the next, triennial update of this review (for the fifth Meeting of Parties in 2011).

1-8 1-9	Was the re-establishment project part of a conservation strategy? If yes, please provide details	Yes Recovery of the UK population. Range expansion in accordance with UK BAP target. See http://www.rspb.org.uk/ourwork/conservation/species/casestudes/corncrake.asp for more information	
2 PR	E-PROJECT ACTIVITIES	Answers	Comments
	ibility study and background research Was a feasibility study carried out?	Yes	Evaluation of potential release sites, modelling of population response (donor and reintroduced populations) carried out in 2001. Trial release of radio-tagged juveniles in 2002.
2-2	Was the project assessed against IUCN re-introduction criteria?	Yes	
2-3	Was a review of historic status conducted?	Yes	See Green, RE & Gibbons, DW 2000. The status of the Corncrake Crex crex in Britain in 1998. Bird Study 47: 129- 137.
2-4	Were the species' critical needs determined?	Yes	Sympathetic management (especially later cutting) of agricultural grasslands. Green, RE & Stowe, TJ 1993. The decline of the Corncrake in Britain and Ireland in relation to habitat change. Journal of Applied Ecology 30: 689-695.
2-5	Was an assessment made of the taxonomic status of individuals to		
2-6	be re-introduced? Was a Population and Habitat Viability Analysis conducted?		
	ious re-introductions Was a review of re-introductions for similar species conducted?	No	Unaware of any re-introductions of migrant crakes
	ce of release site and type Was the release site within the historic range of the species?	Yes	See Holloway, S 1996. The Historical Atlas of Breeding Birds in Britain and Ireland 1875-1900. London: T & AD Poyser.
2-9	Was the release site in the core or at the periphery of the historic	Core	
2-10	rance of the species? Did the release area have assured, long-term protection?	Yes	RSPB Reserve at core and NE WES scheme grasslands elsewhere
	uation of re-introduction site Was the habitat suitability of the release site assessed through scientific investigation?	Yes	Extent of suitable habitat (tall grassland >15 cm, May-August) mapped. Mowing dates of hay fields measured.
2-12	Was there sufficient habitat at the release site to support a viable (self-sustaining) population in the long-term?	Yes	Extent of tall, late mown grassland sufficient for >30 pairs, based upon densitities elsewhere in range.
2-13	Were the causes of decline identified?	Yes	Earlier cutting of grass, switch from hay to silage, edge to centre mowing patterns see Green, RE, Tyler, GA, Stowe, TJ & Newton, AV 1997. A simulation model of the effect of mowing of agricultural grassland on the breeding success of the Corncrake (Crex crex). Journal of Zoology, London 243: 81-115.
	2-13-1 If yes, please indicate the top three causes of decline	Habitat Loss Accidental mortality 3.	Loss hay meadows and early & late cover Destruction of nests & chicks during crop harvesting

2-14			
	Were the causes of decline eliminated or reduced to a sufficient level?	Eliminated	Reserve management sympathetic to needs of corncrake
2-15	Was a habitat restoration programme initiated before re- introduction?	No	Not required
	lability of suitable release stock Was a review of potential release stock conducted?	Yes	Pre-existing captive stock of Polish origin in Germany evaluated. Prosepects of establishing a new captive stock from wild-caught birds from Poland or Scotland also evaluated.
2-17	Was the stock used captive or wild?	Other	Some breeding stock from pre-existing captive stock from Germany, others from chicks taken from the wild in Scotland and Poland in 2005. All released birds are captive-bred.
2-18	If wild stock was used, was the effect on the wild source population assessed?	Yes	Impact on local, national and regional populations of taking 15 second brood chicks from Coll, Argyll assessed by population modelling, using data on population size and demographic rates. Adult males taken from Poland were from areas due to be mowed early in the season, so mortality and failure to breed very likely.
2-19	If captive or artificially propagated stock was used, was it from a population which had been soundly managed both demographically and genetically, according to the principles of contemporary conservation biology?		Soundly managed, but with small number of founders. Hence, new bloodlines introduced from other captive sources and wild-caught Polish and Scottish birds.
2-20	Was stock available on a regular and predictable basis?	Yes	
2-21 2-22	o-economic and legal requirements Was there long-term financial support for the project? Was there long-term political support for the project? Was the duration of the project predicted?	Yes Yes Yes	5-year period planned with evaluation of
2-24	2-23-1 If yes, what duration was predicted? 3-17	How many releases were undertaken?	every year 2002-2006	Ongoing in 2007
	How many birds were released in total?	291	2002-2006 total
3 20	3-18-1 What proportion were juveniles?	91 - 100%	2502 2000 total
		0 - 10%	
	3-18-2 What proportion were adults?		
	3-18-3 What proportion were males?	Don't know	
	3-18-4 What proportion were females?	Don't know	
3-19	Were habitat-enhancement and restoration measures	Yes	Delayed mowing and grazing of release
	undertaken?		areas and areas ro which breeding birds
	under survein.		returned to enhance habitat and improve
			breeding success.
	Was the release stock from a similar habitat to the release site?	Yes	n/a released birds are all captive bred
	Were birds acclimatised to local conditions before release?	Yes	
3-22	Was the re-establishment a hard or soft release?	Soft	Chicks acclimatised to wild insects in
			pens at release site for 20-25 days but
			not fed after release.
3-23	Were there any human interventions, e.g. supplemental feeding?	No	Fed before release but not afterwards
3-24	What proportion of birds were known / thought to survive?	81 - 90%	Survival of radio-tagged sample until
	,,		autumn migration
2-25	Have re-introduced birds bred successfully in the wild?	To some extent	addamin migration
			GBP
3-26	What is the estimated cost of the project (please indicate currency)?	30,000 p.a.	GBP
4 PO	ST-RELEASE ACTIVITIES	Answers	Comments
4-1	Was there post-release monitoring?	Yes	
	4-1-1 If yes, what form did the monitoring take?		
	a. Abundance	Yes	
	b. Productivity (breeding success)	No	
	c. Survival	Yes	Juvenile survival monitored by radio-
	Ci Daivivai	1.63	,
			tagging a sample. Survival to adulthood
			monitored by recapture.
	d. Immigration and emigration (movements)	Yes	
	e. Other		Please state.
			Up to migration for radio-tracking (<1
			month). Whole of each breeding season
	4-1-2 If yes, how long was monitoring conducted for?		for counts.
	1 2 21 yes, now long was monitoring conducted for.

Figure A2-2. Re-establishment questionnaire for a Ferruginous Duck reintroduction project in Spain.

AEWA re-establishment questionnaire			
Questions			
_	Uctions Questions Explanatory notes Contact details OJECT INFORMATION	Answers	*ALWA
1-1 1-2	Species (provide common and scientific names) Country	Ferruginous Duck (Ay Spain	thya nyroca)
1-3 1-4	Organisation(s) involved in the project Address	Donana National Park	, as part of the Ministry of Environment
1-5 1-6 1-7	Telephone number (include international code) Fax number (include international code) Email address		
1-8 1-9	Was the re-establishment project part of a conservation strategy? If yes, please provide details		
2 PR	E-PROJECT ACTIVITIES	Answers	Comments
Feas 2-1 2-2 2-3	ibility study and background research Was a feasibility study carried out? Was the project assessed against IUCN re-introduction criteria? Was a review of historic status conducted?	Partly	There is little information on the Spanish population which is almost extinct, but the biology of the species is well known.
2-4 2-5 2-6	Were the species' critical needs determined? Was an assessment made of the taxonomic status of individuals to be re-introduced? Was a Population and Habitat Viability Analysis conducted?	Yes	See above.
	ious re-introductions Was a review of re-introductions for similar species conducted?		
Choi	ce of release site and type		
2-8	Was the release site within the historic range of the species? Was the release site in the core or at the periphery of the historic range of the species?	Yes	At the beginnning of the century, the Ferruginous Duck population around Donana was estimated to be 500 pairs, it probably was the biggest in Spain.
2-10	Did the release area have assured, long-term protection?		
2-11 2-12	uation of re-introduction site Was the habitat suitability of the release site assessed through scientific investigation? Was there sufficient habitat at the release site to support a viable (self-sustaining) population in the long-term? Were the causes of decline identified?	Yes Yes	Please explain. The release area is located within the Donana National Park. The main causes of decline were hunting
	2-13-1 If yes, please indicate the top three causes of decline	1. Harvesting 2. Habitat Loss 3.	and habitat degradation.
2-14	Were the causes of decline eliminated or reduced to a sufficient	Reduced sufficiently	The release area has been rehabilitated
2-15	Was a habitat restoration programme initiated before re- introduction?		and hunting is banned. Please explain.
2-16 2-17 2-18 2-19	lability of suitable release stock Was a review of potential release stock conducted? Was the stock used captive or wild? If wild stock was used, was the effect on the wild source population assessed? If captive or artificially propagated stock was used, was it from a population which had been soundly managed both demographically and genetically, according to the principles of contemporary conservation hislony? Was stock available on a regular and predictable basis?	Captive Not applicable	If Other, please explain.
Saci	o-economic and legal requirements		
2-21 2-22	o-economic and legal requirements Was there long-term financial support for the project? Was there long-term political support for the project? Was the duration of the project predicted? 2.223.1 Figure what duration was predicted?	No No No	

2-25 2-26 2-27 2-28 2-29	Were socio-economic studies conducted to assess impacts, costs, and benefits of the re-establishment programme to local human populations? Was an assessment made of the attitudes of local people? Were local communities supportive of the re-introduction project? Was a communication and education programme undertaken? Was the country's re-introduction policy consulted? Did the project have permission of the relevant government agencies and land-owners? ANNING, PREPARATION AND RELEASE STAGES List the organisations which were consulted about the re-introduction project.	No No Yes	Work was carried out by the Donana National Park, dependent of the Ministry of the Environment. Comments
3-4	Was a multidisciplinary team of experts established? Were short-term success indicators identified? Were long-term success indicators identified? Was the release stock genetically screened? Was the release stock screened for disease?	No No No Partly	Please explain. Please explain. No genetic screening of release stock was done. Captive breeding was done under strict
3-10 3-11	If wild stock was used, was it from an indigenous population, or from an already reintroduced one (was it a serial translocation)? Was the health of the release stock monitored before release? Was veterinary support available? Was a release strategy prepared? Was there a public awareness programme associated with the project? Was there local community involvement?		veterinary control.
3-14 3-15	Year of start of planning. Year of start of re-introduction. Year of finish of re-introduction. Year of finish of project.		
	How many releases were undertaken? How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females?	100	Population is thought to be between 20 and 25 pairs.
	Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site?	Yes	Please explain. Captive breeding was carried out within
3-21	Were birds acclimatised to local conditions before release?	Yes	the release area. Captive breeding was carried out within
3-22	Was the re-establishment a hard or soft release?	Hard	the release area. Since birds were born near the release area, they were released right after they
3-24 3-25	Were there any human interventions, e.g. supplemental feeding? What proportion of birds were known / thought to survive? Have re-introduced birds bred successfully in the wild? What is the estimated cost of the project (please indicate currency)?	No To great extent	20 pairs in the last years. Indicate currency here.
4 PO	ST-RELEASE ACTIVITIES	Answers	Comments
<u>4-1</u>	Was there post-release monitoring?	Yes	Release area is regularly monitored.
	4-1-1 If yes, what form did the monitoring take? a. Abundance b. Productivity (breeding success) c. Survival d. Immigration and emigration (movements) e. Other 4-1-2 If yes, how long was monitoring conducted for?		Please state.
4-2	Was there an evaluation of cost-effectiveness and/or re-introduction success? 4-2-1 If yes, was the project considered cost-effective? 4-2-2 If yes, was the project considered a re-introduction success?	No	It was not thought to be necessary. Costs were low since means and facilities used were already in place.

A-4 Was information collected on causes of mortality in released birds?

	Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site?		Please explain.
	was the release stock from a similar habitat to the release site? Were birds acclimatised to local conditions before release?	Partly	They were in most of all releases. These were carried out next to the breeding centre within Donana National Park.
3-23 3-24 3-25	Was the re-establishment a hard or soft release? Were there any human interventions, e.g. supplemental feeding? What proportion of birds were known / thought to survive? Have re-introduced birds bred successfully in the wild? What is the estimated cost of the project (please indicate currency)?	Hard No 61 - 70% To some extent	20-30% disappeared in the first year At least 40 pairs bred. Indicate currency here.
4 PO	ST-RELEASE ACTIVITIES	Answers	Comments
<u>4-1</u>	Was there post-release monitoring?	Yes	For at least three years, an intensive monitoring of the released birds took place. All birds were ringed. After that volunteers and amateurs have constantly provided data on released birds.
	4-1-1 If yes, what form did the monitoring take? a. Abundance		
	b. Productivity (breeding success) c. Survival		
	d. Immigration and emigration (movements) e. Other		Please state.
	4-1-2 If yes, how long was monitoring conducted for?	2+ years	
4-2	Was there an evaluation of cost-effectiveness and/or re-introduction success?	Yes	
	4-2-1 If yes, was the project considered cost-effective? 4-2-2 If yes, was the project considered a re-introduction success?	Yes	

- 4-3 Please explain what criteria were used to determine success.
- Was information collected on causes of mortality in released
- Did habitat protection measures continue after re-introduction?
 Were public relation activities continued after re-introduction?
 Were the results published in popular literature?
- 4-5 4-6 4-7
- Were the results published in scientific literature?

4-8-1 If yes, please provide references

The wild population is now estimated to be about 1200 birds. There is no need for further re-introductions. Key factors in the success: 1 The age of the released birds

- Captive breeding taking place within the release area
 The general state of released birds (healthy and untamed)

No	Only 3 birds were found dead.
Yes No	Not only continued, but increased.
Yes	

Only one article was published. Information concerning this reintroduction is kept in the Ministry of the Environment.

Figure A2-9. Re-establishment questionnaire for a White-headed Duck reintroduction project in Italy.

AEWA re-establishment questionnaire Questions 1 PROJECT INFORMATION Answers Species (provide common and scientific names) White-headed Duck (Oxvura leucocephala) Organisation(s) involved in the project LIPU (Italian League Protection of Birds) ria Trento 49, 43100 Parma Gargano National Park via S. Antonio Abate 121, 71037 Monte Sant'Angelo (FG) Telephone number (include international code) (1) 0039-521273043, (2) 0039-88456891 1-6 Fax number (include international code) (1) 0039-521273419, (2) 0039-884561348 Email address Was the re-establishment project part of a conservation strategy? If yes, please provide details 2 PRE-PROJECT ACTIVITIES Answers Comments Feasibility study and background research Was a feasibility study carried out? Was the project assessed against IUCN re-introduction criteria? Partly 2-3 Was a review of historic status conducted? Yes Were the species' critical needs determined? Partly Was an assessment made of the taxonomic status of individuals to be /es re-introduced? Was a Population and Habitat Viability Analysis conducted? Yes Although based upon data from other Previous re-introductions Was a review of re-introductions for similar species conducted? Partly Within the feasibility study, success or failure causes of similar projects conducted in Spain and Hungary for White-headed Duck reintroduction, were analysed. Also the experiences in Sardinia and Corsica were considered Choice of release site and type Was the release site within the historic range of the species? Yes Was the release site in the core or at the periphery of the historic Considering the highly-fragmented range of the species? historic distribution of this species in Italy, it's difficult to assess the position of the releasing sites. However, Italy is in a central position between Eastern and Western populations. 2-10 Did the release area have assured, long-term protection? Yes The release sites are included in the Gargano National Park Evaluation of re-introduction site 2-11 Was the habitat suitability of the release site assessed through /es scientific investigation? 2-12 Was there sufficient habitat at the release site to support a viable (self-Ves The release sites are about 500 ha but sustaining) population in the long-term? they are surrounded by a lot of smaller etlands which should be enough to pport a viable population 2-13 Were the causes of decline identified? 2-13-1 If yes, please indicate the top three causes of decline illegal too 2-14 Were the causes of decline eliminated or reduced to a sufficient level? Reduced sufficiently Currently, poaching still exist but it is 2-15 Was a habitat restoration programme initiated before re-introduction? Νo Availability of suitable release stock 2-16 Was a review of potential release stock conducted? 2-17 Was the stock used captive or wild? 2-18 If wild stock was used, was the effect on the wild source population assessed? 2-19 If captive or artificially propagated stock was used, was it from a population which had been soundly managed both demographically and genetically, according to the principles of contemporary conservation biology?

2-20	Was stock available on a regular and predictable basis?	No	Due to problems in chick rearing (high mortality)
	economic and legal requirements Was there long-term financial support for the project?	Yes	
	Was there long-term political support for the project?	Partly	
	Was the duration of the project predicted?	Yes	
	2-23-1 If yes, what duration was predicted?	4 - 5 years	Only considering the period for the releases
2-24	Were socio-economic studies conducted to assess impacts, costs, and benefits of the re-establishment programme to local human	No	
	populations?		
	Was an assessment made of the attitudes of local people?	No	
2-26	Were local communities supportive of the re-introduction	Partly	
2-27	project? Was a communication and education programme undertaken?	Partly	Leaflets and posters were circulated to
2-28	Was the country's re-introduction policy consulted?	Yes	increase public awareness
	Did the project have permission of the relevant government agencies	Yes	
	and land-owners?		
3 PL/	ANNING, PREPARATION AND RELEASE STAGES	Answers	Comments
3-1	List the organisations which were consulted about the re-introduction project.	Italian Wildlife Institute	e (INFS) - Ministry of Environment
3-2	Was a multidisciplinary team of experts established?	Yes	
3-3	Were short-term success indicators identified?	Yes	
	Were long-term success indicators identified?		
	Was the release stock genetically screened?	No	
3-6	Was the release stock screened for disease?	Yes	
3-7	If wild stock was used, was it from an indigenous population, or from		
	an already reintroduced one (was it a serial translocation)?	M	
3-8 3-9	Was the health of the release stock monitored before release? Was veterinary support available?	Yes	
	Was a release strategy prepared?	Yes Yes	
	Was there a public awareness programme associated with the project?	Partly	see point 2-27
5 11	was there a public awareness programme associated with the project:	Partiy	see point 2 27
2-12	Manches lead as such in the involvement		
3-12	Was there local community involvement?	No

Figure A2-10. Re-establishment questionnaire for a Lesser White-Fronted Goose re-introduction project in Finland.

AEWA re-establishment questionnaire Questions 1 PROJECT INFORMATION Answers Species (provide common and scientific names) Lesser White fronted Goose, Anser erythropus Organisation(s) involved in the project Ass, the Friends of the White fronted Goose o Dr. Antti Haapanen, Huhtasuontie 7, 00950 Helsinki inland Telephone number (include international code) 358 9 3253804 1-6 Fax number (include international code) Email address Was the re-establishment project part of a conservation strategy? If yes, please provide details The aim of our association is to reintroduce the species as a Finnish breeding species. The project is at present in its preliminary phase. In coming future we hope to enter into real process. 2 PRE-PROJECT ACTIVITIES Comments Answers Feasibility study and background research he Swedish introducion serves as a Was a feasibility study carried out? /es easibility study Was the project assessed against IUCN re-introduction criteria? Yes Was a review of historic status conducted? Yes Were the species' critical needs determined? Yes 2-5 Was an assessment made of the taxonomic status of individuals to be re-introduced? Was a Population and Habitat Viability Analysis conducted? Previous re-introductions Was a review of re-introductions for similar species conducted? Choice of release site and type Was the release site within the historic range of the species? 2-9 Was the release site in the core or at the periphery of the historic range of the species? 2-10 Did the release area have assured, long-term protection? Evaluation of re-introduction site 2-11 Was the habitat suitability of the release site assessed through ntroductions are made in an area where scientific investigation? here has exsisted a breeding population. We do not see any majoer changes in the breeding habitat quality. 2-12 Was there sufficient habitat at the release site to support a viable (self-The whole nothernmost Yes sustaining) population in the long-term? subarctic/subalpine region and northenmost part of theboreal region forms an extensive habitat for the species. 2-13 Were the causes of decline identified? Yes overhunting, mostly during the migration and wintering 2-13-1 If yes, please indicate the top three causes of decline Harvesting Harvesting 2-14 Were the causes of decline eliminated or reduced to a sufficient level? Eliminated hecauses were eliminated by changing he migration route 2-15 Was a habitat restoration programme initiated before re-introduction? Partly In Sweden and Finland there has been extensive restoration of Baltic Sea coasta Availability of suitable release stock 2-16 Was a review of potential release stock conducted? Yes 2-17 Was the stock used captive or wild? Captive If Other, please explain 2-18 If wild stock was used, was the effect on the wild source population Nο assessed? 2-19 If captive or artificially propagated stock was used, was it from a Yes Yes. To our best knowledge population which had been soundly managed both demographically and genetically, according to the principles of contemporary conservation biology? 2-20 Was stock available on a regular and predictable basis? Yes Socio-economic and legal requirements No official suppert. The ass. is committed. 2-21 Was there long-term financial support for the project? Partly

2-22	Was there long-term political support for the project?	Don't know	There is a local court decision in favour.
2-23	Was the duration of the project predicted?	Don't know	
2-24	2-23-1 If yes, what duration was predicted? Were socio-economic studies conducted to assess impacts, costs, and	No	\vdash
	benefits of the re-establishment programme to local human populations?		
	Was an assessment made of the attitudes of local people?	Partly	
2-26	Were local communities supportive of the re-introduction project?	Yes	
	Was a communication and education programme undertaken? Was the country's re-introduction policy consulted?	No Not applicable	It was tried. The Min. of Env. refused to
			cooperate
2-29	Did the project have permission of the relevant government agencies and land-owners?	Yes	The decision of the local court.
3 PLA	NNING, PREPARATION AND RELEASE STAGES	Answers	Comments
3-1		No one	
	re-introduction project.	No one	
3-2	Was a multidisciplinary team of experts established?	No	
3-3	Were short-term success indicators identified?	Yes	Observations in the wintering site in Netherlands
3-4	Were long-term success indicators identified?	Yes	Breeding population in the Finnish
3-5	Was the release stock genetically screened?	Yes	Lapland
3-6 3-7	Was the release stock screened for disease? If wild stock was used, was it from an indigenous population, or from	Yes	
	an already reintroduced one (was it a serial translocation)?		
	Was the health of the release stock monitored before release? Was veterinary support available?		
	Was a release strategy prepared? Was there a public awareness programme associated with the project?		
	Was there local community involvement?		
	Year of start of planning. Year of start of re-introduction.	1999 2004	
3-15	Year of finish of re-introduction.	Unknown	
3-16	Year of finish of project.	Unknown	
	How many releases were undertaken?	information only for	formation will be given on 3-17 and 3-18
3-17	The many releases were endertaken.		
	How many birds were released in total?	our own use	
	How many birds were released in total? 3-18-1 What proportion were juveniles?		
	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults?		
	How many birds were released in total? 3-18-1 What proportion were juveniles?		
3-18	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males?	our own use	Habitat restoration has been made south
3-18	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females?		from breeding area, but important resting
3-18 3-19 3-20	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females? Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site?	Partly Don't know	
3-18 3-19 3-20 3-21	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females? Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site? Were birds acclimatised to local conditions before release?	Partly Don't know	from breeding area, but important resting
3-18 3-19 3-20 3-21 3-22	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females? Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site? Were birds acclimatised to local conditions before release? Was the re-establishment a hard or soft release?	Partly Don't know Yes Don't know	from breeding area, but important resting
3-18 3-19 3-20 3-21 3-22 3-23	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females? Were habitat-enhancement and restoration measures undertaken? Was the release stock from a similar habitat to the release site? Were birds acclimatised to local conditions before release? Was the re-establishment a hard or soft release? Were there any human interventions, e.q. supplemental feeding?	Partly Don't know Yes Don't know No	from breeding area, but important resting
3-19 3-20 3-21 3-22 3-23 3-24	How many birds were released in total? 3-18-1 What proportion were juveniles? 3-18-2 What proportion were adults? 3-18-3 What proportion were males? 3-18-4 What proportion were females?
